Harding Road
Franklin TN 37046.

Dear Perry.

AUTHOR OF "CLINIC"

In response to your request I enclose three writings descriptive of different aspects of my study. Hopefully this is close to something you can reduce to a level readable by the average.

As I ever remain an "egg head" unfortunately when I write I pump everything into it!!

I also remain in occasional contact with Dr. E. McDonagh of Kansas City. I initially contacted him because, since the 1960's, his experience in ETA therapy involves between 20,000 to 25,000.

RIDDING

As I may have indicated to you, in my opinion, EDTA acts as a surrogate D vitamin. I did the body of arterial deposits of molecular calcium by ionizing it just as my D therapy ionizes the calcium prescribed with it to relieve symptoms and diseases which arise due to ionic calcium deficiency which was enforced by defects of lifestyle.

In my opinion, also, the "fringe benefits" of EDTA therapy represent my "ionic calcium deficiency symptoms and diseases".

I had hoped to induce Dr. Mc Donagh to enter into clinical research on his patients applying that "suspicion" but he didn't pick it up.

I met him in Anaheim in late 1993 at an ACAM meeting

I believe that chronic deficiency of the D vitamins is the basis of molecular deposition of calcium in arteries giving rise to arteriosclerosis.

I intend to send a package of this material off to Dr. Contrares. Possibly his group will be interested in applying my research. Possibly, also, he has advice to give re my recent affliction!!

I will send a copy of THE ORIGIN --- to TLfd.

Sincerely,
