

November 31, 1986

Dear Physician, Scientist, Board Member, Friend

The photorgraph printed below shows an atypical cell from my blood on a visit to Lida Mattman, Ph.D. (Wayne University) and Phillip Hoekstra, III, Ph.D. [See [PhilipHoekstra1986-11-30.pdf](#) letter.]

Hoekstra demonstrated dark-field microscopy, Cell Wall Deficient *Candida albicans* and other interesting tidbits

I was particularly intrigued with Hoekstra's comments as per other side of this page, and felt that your interest might also be piqued.

If you have a dark-field microscope, it might be worthwhile to correlate the finding of similar lymphocytes in your patients, and to determine if a high correlation exists between such atypical forms and the presence of Rheumatoid Disease in either the patient or relatives associated with the patient.

Please let me know what you find.

Cordially,

Perry A. Chapdelaine, Sr.
