***Introduction and Orientation for All
Magnetic Health Quarterly Publications***

Published by:
William H. Philpott, M.D.
17171 SE 29th St.
Choctaw, OK 73020
(405) 390-3009/ Fax: (405) 390-2968
Email: polarp@flash.net

William H. Philpott, M.D.

FIRST IMPORTANT NOTE

The first 17 pages are introductory in nature and to be found at the beginning of each of Dr. Philpott's works.

It's important that you read and understand these basic principles before you study beyond page 17.

If you are thoroughly familiar with these first 16 pages, and understand their contents, then by all means, start with page 17.

SECOND IMPORTANT NOTE

All of Dr. Philpott's books, including this one, can be ordered directly from him at 17171 S.E. 29th Street, Choctaw, OK 73020; (405) 390-3009.

Appropriate magnets can also be ordered from the same source. See Magnetic Catalog entitled "Polar Power Magnets" Catalog #18, this site. We've added to this catalog several pages relevant to costs.

Dr. Philpott says that he will be pleased to answer questions by telephone. Information

WHAT MAGNETIC THERAPY IS

Magnetic therapy is magnetic-electron-enzyme catalysis therapy. Static magnetic fields move electrons which rotate resulting in a magnetic-electron energy field. Static negative magnetic field electrons spin in a 3-dimensional spiral counterclockwise rotation. In a static positive magnetic field, electrons spin in a 3-dimensional spiral clockwise rotation. A positive magnetic field energizes acid-dependent enzymes. A negative magnetic field energizes alkaline-dependent enzymes. Biological response to a positive magnetic field is acid-hypoxia. Biological response to a negative magnetic field is alkaline-hyperoxia. Alkalinity maintains calcium and amino acid solubility and reverses insoluble deposits of calcium and amino acids in such as arteriosclerosis, spinal stenosis, around joints, amyloidosis, Alzheimer's, etc.

The energy activation of biological enzymes is magnetic therapy

WHAT MAGNETIC THERAPY DOES

The biological response to a static positive magnetic field is acid-hypoxia. The biological response to the static negative magnetic field is alkaline-hyperoxia. Positive magnetic field therapy is limited to brief exposure to stimulate neuronal and catabolic glandular functions. Positive magnetic field therapy should be under medical supervision due to the danger of prolonged application, producing acid-hypoxia.

Negative magnetic field therapy has a wide application in such as cell differentiation, healing, production of adenosine triphosphate by oxidative phosphorylation and processing of toxins by oxidoreductase enzymes and resolution of calcium and amino acid insoluble deposits. Negative magnetic field therapy is not harmful and can effectively be used both under medical supervision and self-help application.

Some of the values of magnetic therapy are:

- Enhanced sleep with its health-promoting value by production of melatonin.
- Enhanced healing by production of growth hormone.
- Energy production by virtue of oxidoreductase enzyme production of adenosine triphosphate and catalytic remnant magnetism.
- Detoxification by activation of oxidoreductase enzymes processing free radicals, acids, peroxides, alcohols and aldehydes.
- Pain resolution by replacing acid-hypoxia with alkaline-hyperoxia.
- Reversal of acid-hypoxia degenerative diseases by replacement of acid-hypoxia with alkaline-hyperoxia.
- Antibiotic effect for all types of human-invading microorganisms.
- Cancer remission by virtue of blocking the acid-dependent enzyme function producing ATP by fermentation.
- Resolution of calcium and amino acid insoluble deposits by maintaining alkalization.
- Neuronal calming providing control over emotional, mental and seizure disorders.

"Magnetic therapy has been observed to have the highest predictable results of any therapy I have observed in 40 years of medical practice."

William H. Philpott, M.D.

ABOUT WILLIAM H. PHILPOTT, M.D.

William H. Philpott, M.D. has specialty training and practice in psychiatry, neurology, electroencephalography, nutrition, environmental medicine and toxicology.

Medical data is for informational purposes only. You should always consult your family physician, or one of our referral physicians prior

He is a founding member of the Academy of Orthomolecular Psychiatry. He is a fellow of the Orthomolecular Psychiatric Society and the Society of Environmental Medicine and Toxicology, and life member of the American Psychiatric Association.

Between 1970 and 1975, he did a research project searching for the causes of major mental illnesses and degenerative diseases, which resulted in the publication of the books, *Brain Allergies* and *Victory Over Diabetes*.

Retiring in 1990 after 40 years of medical practice, he has engaged in research as a member of an Institutional Review Board, which follows FDA guidelines. In this capacity, he guides physicians and gathers data on the treatment and prevention of degenerative diseases using magnetic therapy.

The Linus Pauling Award was presented to William H. Philpott, M.D. in 1998 by the Orthomolecular Health Society, "for his scientific leadership and scholarship spanning the entire history of orthomolecular medicine."

Dr. Philpott says, "When I graduated from medical school, the guest speaker stated, "We have taught you what we know. It may well be that half of what we have taught you is not so. But we don't know which half is so and which half is not so". I learned so much in medical school that I was proud of my acclimation of knowledge. Was this speaker for real or simply a learned clinician acting out a false humility? As I marched down the aisle of graduation from medical school, I was proud of my increased amount of knowledge I had gained. I was especially proud of knowing about medications that were known to relieve headaches. Surely among these medications for headaches was an answer for my mother's headaches. I thought that now I have a solution to the lonely hours I spent as a preschooler while my mother was in bed in a dark room. I was all alone wondering how I could help my mother.

"I specialty trained in neurology and psychiatry and had a flourishing practice in these specialties. After fifteen years of practice, I began to wonder why we had so few answers that worked. There was shock treatment for severely ill patients. I gave over 70,000 of these. There were tranquilizers emerging in the late 50's and early 60's. I used these by the bushels on my mental patients. The efficiency was low and the side effects of tranquilizers were astoundingly frightening. One tranquilizer in an ad in a medical journal claimed less side effects than another tranquilizer and yet it took one-half page of fine print to list the side effects of this proposed better tranquilizer.

"I had six therapists (psychologists, social workers and sociologists) seeing my patients in individual and group therapy. The level of results in schizophrenia and manic-depressives was especially discouraging. In the early 60's, behaviorism came to the rescue in helping some neurotics in the ability to train out their symptoms. What about psychosis for which behaviorism had little help? Electric shock proved to have some temporary help. Tranquilizers were of minor help and the side effects were appalling. Obviously, our system was often even making our patients develop physician-induced illnesses. This was particularly troubling with a five-fold increase in maturity-onset diabetes mellitus when using tranquilizers. Were there answers not learned in residency training that we were ignoring?

"In my third year of medical school in 1949, while attending a small group session at Los Angeles County General Hospital, an allergist made the observation about a patient with anxiety whom he fasted for five days during which her anxiety symptoms left. When he exposed her to a test meal of one of her frequently eaten foods, her anxiety returned. He asked, what is the diagnosis? I was studying medicine with the expressed pur-

pose of becoming a psychiatrist. I spoke up, giving the diagnosis of anxiety-neurosis. He said, "No. This is a food allergy". The rumor was that this allergist had ideas that most of my instructors did not agree with. I dismissed his diagnosis until twenty years later (1969).

"In my second year of psychiatric residency training, I read the book *Neurosis* by Walter Alvarez, M.D. In this book, he describes headaches and many symptoms of neurosis and psychosis occurring during deliberate food testing. I could not believe this. I thought Dr. Alvarez made a fool of himself. After all, he was an internist, not a psychiatrist and why was he dabbling into psychiatry. I dismissed his observations and didn't look at this book again for 16 years. I was wrong for ignoring him.

"I learned behaviorism from Joseph Wolpe, M.D. He and I shared the opinion that schizophrenia must be organic in origin. In 1965, he sent me an article by Theron G. Randolph, M.D.

"Amazingly, Dr. Randolph described many mental and physical symptoms as disappearing on a five day fast and re-emerging during food tests on deliberate food tests of single foods. I set this article aside as impossible.

"In 1969, I was a consultant to a boarding school of some 100 socially and educationally disordered adolescents. I was responsible for a neurological and psychiatric examination on each student. One-third either were or had been psychotic. Saul Klotz, M.D. Internist-Allergist was responsible for their physical needs. He proposed to me that we do a double-blind study to determine the extent to which food allergies and non-allergic hypersensitive reactions related to their numerous symptoms. Together we did a double-blind study using food extracts. The results were overwhelmingly positive. I now had to consider how wrong I had been by ignoring the evidence that had come to me through the years concerning maladaptive reactions to foods and symptom-production.

"I was invited by a private psychiatric hospital to set up a study to determine the causes of schizophrenia. Based on the double-blind study of Saul Klotz, I initiated a study of the relation of foods to symptoms in my mental patients. To this, we added a nutritional survey and a survey for infectious agents. This research followed the advice of Theron G. Randolph, M.D. of a five day fast preceding food testing of single foods. This study resulted in the publication of two books, *Brain Allergies* and *Victory Over Diabetes*. From 1970 through 1990, I tested thousands of both psychiatric and non-psychiatric patients with a five day fast followed by deliberate food testing. The patients were monitored for pH changes and blood sugar changes. Viruses, especially Epstein-Barr, cytomegalovirus and human herpes virus #6 emerged as being consistently in our mental patients and those with more serious physical symptoms. All patients maladaptively reacting to foods had some degree of carbohydrate disorder. Maturity-onset diabetes emerged as the end result of prolonged reactions of food addiction. The brain/gut relationship was obvious.

"Therefore, during my testing I observed many minor to major gut reactions to foods. In 1973, a schizophrenic young man entered my research program. His father, president of a bank in Houston, was so impressed by his son's recovery that he proposed a \$4,000,000 research program using my method of treatment. This money was to be provided to the medical school at Galveston over a four year period. I was invited to Galveston to do the project. However, I was satisfied with my current research program and decided not to move to Galveston for it. I went to Galveston and explained my system of diagno-

Medical data is for informational purposes only. You should always consult your family physician, or one of our referral physicians prior sis and treatment of psychotics. The medical school accepted the \$4,000,000.

“To my amazement, they didn’t do anything I had outlined. Instead, they diverted the money to other projects but did do a Rossette test on a few schizophrenics. The results are published in the book, *The Biology of the Schizophrenic Process* edited by S. Wolfe. The conclusions from the Rossette test is that schizophrenia is either an immunologic reaction or a viral infection since both of these look the same on the Rossette test. This did confirm my findings but disappointingly, did not provide a statistical value of my treatment.

“It is a strange phenomena that there is inherently a resistance for doctors to recognize the relationship between foods and the development of both acute symptoms and chronic degenerative diseases. Some say they are waiting for more evidence such as more double-blind studies or the resolution of conflicting data. It appears to me that this waiting for evidence which really is already here in abundance, is not really the central problem.

“The problem is that it is hard for doctors to change their behavior once they have learned a comfortable set of routines. Doctors, by and large, have obsessive-compulsive personalities. This serves them well in their massive amount of learning that they need to do during medical school and residency training, however, it also serves as a handicap in making changes. The physician becomes comfortable with a set of routines and uncomfortable with making any changes. Also, there are outside pressures such as, if a specialist changes his routines, he will lose some of his referral resources. Physicians, for many reasons, find it difficult and anxiety-producing, to make changes. In my opinion, this mediates against progress more than any other thing.

“The addition of magnetic therapy to my ecology and infection program became a natural. It had been demonstrated by Albert Roy Davis that a negative (south-seeking) magnetic field both alkalizes and oxygenates the biological system. I had already determined by my monitoring that symptom-producing reactions to foods or chemicals was acidifying and oxygen-reducing. I used alkalizing agents such as soda bicarbonate and oxygen to relieve symptoms. I found that a negative (south-seeking) magnetic field was more predictable in relieving symptoms than alkalization with soda bicarbonate. I had demonstrated that degenerative diseases were simply the extensions in time of the acute reactions in which the disordered chemistry of the acute reaction and of the chronic disease having the same symptoms was identical. It became logical then to extend the time of the application of a negative (south-seeking) magnetic field to reverse and heal degenerative diseases along with avoiding the foods, being well-nourished and treating the viral infections. I was delighted to find that a negative (south-seeking) magnetic field will kill microorganisms whether they are viruses, fungi, bacteria, parasites or cancer cells. Gastrointestinal disorders encompass diseased conditions of the entire gastrointestinal tract (gastrointestinal) from mouth to anus and in organs associated with the gastrointestinal tract such as the gallbladder, liver, and pancreas, emptying excretory contents into the gastrointestinal. The diagnostic classification of these gastrointestinal disorders encompass such as 1) infections, 2) immunologic reactions, 3) the minor gastrointestinal reflux states and irritable bowel disorders as well as the major inflammatory bowel diseases (celiac disease, Crohn’s disease and ulcerative colitis).

“Viral infections, especially noted as herpes simplex I

with lesions on the lips and mucous membrane of the mouth, chronic bacterial infections of the mucus membrane of the mouth and the gums around the teeth, and acute bacterial infections of the mouth and throat such as acute streptococcus infection. The esophagus can be acutely or chronically infected the same as the mouth. The stomach and duodenum can be infected with helicobacter pylori producing ulcers. The gallbladder and pancreas can be acutely or chronically infected with microorganisms. The liver can be acutely or chronically infected with microorganisms, especially noted is viral hepatitis. Cirrhosis of the liver can develop secondary to these infections and or due to the processing of toxins. The anus and adjacent colon can be infected with microorganisms. The small and large colon can be infected with viruses, bacteria, fungi and parasites.

“There are several specific identifiable bacteria that can cause diarrhea and inflammation of the colon. There are specific antibiotics useful in killing these bacteria. My objective observation is that a negative (south-seeking) magnetic field can kill all types of microorganisms (viruses, bacteria, fungi and parasites). This fact is fundamental in understanding the value of magnetic therapy. It is logical to use antibiotics specific for each infection. Magnetic therapy using a negative (south-seeking) static magnetic field and colloidal silver providing a negative (south-seeking) static magnetic field can be used along with the specific antibiotics or used without the antibiotics.”

William H. Philpott, M.D.’s Response upon receiving the Linus Pauling Award

“I really thank you a lot for this. I just wanted to say that Linus Pauling was a friend of mine and he wrote the foreword to my book, *Brain Allergies* and I thought I would just read a little bit of this so that you would see his attitude towards my work.”

“The concept that a change in behavior and in mental health can result from changing the concentrations of various substances that are normally present in the brain is an important one. This concept is the basis of orthomolecular psychiatry, a subject that is treated in considerable detail by Dr. William Philpott and Dwight Kalita in their book, *Brain Allergies*. The other general concept, also a closely related one, is that of human ecology. The idea is that substances in our environment can have a profound effect on mental health and behavior. These can be introduced into the environment as a result of our technical culture.”

“I just wanted you to realize that Linus Pauling did appreciate ecology and nutrition both, and said so in this forward to my book. We shared that as a common interest. I have been the one that was responsible for introducing ecology to orthomolecular medicine and the orthomolecular ideas to ecology medicine. I have been a catalyst in getting orthomolecular medicine and environmental toxicology medicine together. This organization needs to, and is, furthering the interest of Linus Pauling and this very important focus in medicine. It will make a difference and I want to congratulate all of you for this interest; keep it growing because it will become a more substantial part of medicine.”

Ethics of Magnetic Diagnosis and Therapy

Magnetic instruments that have been cleared by the FDA and can make claims of value within the limits of their clearance -- these FDA cleared instruments include but are not exclusive to MRI, XOMED hearing aid, TENS class of instruments, diapulse, nerve testing instruments, Magneto encephalogram, Magneto cardiogram, etc. Industrial magnets have not been cleared as medical instruments and cannot claim cure for any condition or disease. Research is in process to enlarge the scope of claims of value of magnetic therapy. The person using magnets to treat a disease needs to become party to a medical supervised magnetic research project. The

Depth of Penetration / Gauss Field Strength

Antibiotic and anti-cancer therapy require a minimum of 25 gauss. The higher the gauss strength, the more therapeutic.

Medical data is for informational purposes only. You should always consult your family physician, or one of our referral physicians prior magnets used as described in *The Magnetic Health Quarterly* are industrial magnets for which no claim of cure of disease is made. The application of industrial magnets for sleep and pain is a popular self-help application. The magnetic treatment of diseases demands medical supervised diagnosis and treatment in link with a research institutional review board following FDA guidelines for research. William H Philpott, M.D. presents his observations, theories, research protocols and answers to questions for consideration in the hopes of making progress in the application of Magnetic Therapy. Those interested in becoming party to the magnetic research project should contact William H. Philpott, M.D. The goal of research is to firmly establish magnetic therapy as a part of traditional allopathic medicine, which will popularize the application of and provide for insurance coverage for magnetic therapy.

Those choosing to proceed with use of magnets for medical purposes without medical supervision do so on their own responsibility. There is no restriction of the purchase of magnets for whatever reason they are used. There is no restriction on the writing, releasing, acquiring or purchasing of information about magnets.

Disclaimer

I do not claim a cure for any degenerative disease or even guarantee relief of pain or insomnia by means of magnets. My only claim is that there is evidence justifying a definitive controlled research project following Federal Food and Drug Administration (FDA) guidelines to determine the value and limitations of magnetic therapy. These guidelines require a physician diagnosis and physician monitoring under the supervision of a Scientific Institutional Review Board. The application of magnetic fields to humans has been approved by the FDA, which were based in part on toxicity studies, and has been classified as "not essentially harmful".

How Dr. Philpott Changed His Medical Practice

This *Magnetic Health Quarterly* represents my personal focus on health maintenance and disease reversal that has developed from my four years of basic medical school education, specialty training in neurology, psychiatry, allergy-immunology, forty years of medical practice, and my post-retirement research that guides physicians in an examination of the values of static magnetic field application to prevent and reverse degenerative diseases. I am proud to be a medical physician and I am convinced that medical science has a central truth about health maintenance and disease. The improvement in medical practice during my period of practice and observation has been tremendous. Beyond the progress what can and what should we incorporate in established scientific knowledge to the practice of medicine? This *Magnetic Health Quarterly* is involved with what I have observed that has been largely ignored or left out in spite of the abundance of information on the respective subjects. I have systematically recorded my observations concerning these neglected areas.

The public, through their congressional representatives have mandated the National Institutes of Health to widen its scope of research to include promising alternative areas beyond the current traditional application of medical science. This is a wise move since there are valuable alternative areas that have been neglected or ignored. To fulfill its mandated obligation, the National Institutes of Health have appointed advisory committees in important scientific areas to provide guidelines for research. One of the advisory committees is the Electromagnetic Committee, which includes five Ph.D. physicists, and two M.D.'s knowledgeable in electromagnetics. The two M.D.'s are Robert O. Becker, M.D. and myself. Based on the recommendations of this committee, research projects financed by NIH grants are in process.

Biochemistry has become more readily understood than biophysics. Biochemistry has developed many promising, symptom-relieving agents and synthetic replacements for the failing human system. Biochemistry has helped us come to understand the role of nutrition, the role of oxygen, and the roles of many, many more necessary biochemical functions of human metabolism. There are great economic rewards for those marketing these valuable biochemicals. Biophysics has more slowly progressed in its medical applications. The current medical horizon holds the promises of biophysics being equal to or even superior to the therapeutic values of biochemistry. This emerging promise of values especially relates to the biological responses to magnetic fields. The values of biological responses to heat and cold have been well incorporated into physical medicine while the biological responses to magnetic fields has been neglected.

The biological response to magnetic fields has been, to a considerable degree, a mystery until recently. Medical science has been using magnetism without knowing it was using magnetism. Examples are such as electro-convulsive therapy used in mental illness. We can now understand that electricity produces magnetic fields. For example when an electric current produces a high neuronal exciting positive (north-seeking) magnetic field it produces a seizure, following which the brain switches its magnetic polarity from a usual positive (north-seeking) to a negative (south-seeking) magnetic field for a few minutes. This electromagnetic-produced general anesthesia calms neuronal functions and relieves mental symptoms. The thousands of enzyme catalytic reactions occurring in human physiology are energy-driven by magnetic fields. By understanding magnetic field energy enzyme catalysis, we no longer assume some mysterious, spontaneous enzyme catalysis, but instead, with this new knowledge, magnetic fields can be harnessed to energy-drive specific desired enzyme catalysis. Thus, a static negative (south-seeking) magnetic field can be arranged to produce melatonin and growth hormone during sleep. A static negative (south-seeking) magnetic field can be harnessed to enzymatically produce adenosine triphosphate (ATP) and reverse the inflammatory consequences of oxidation reduction end-products (free radicals, peroxides, acids, alcohols and aldehydes) in which oxygen is released from its bound state in these inflammatory products.

It is universally true that no one wants to admit that they have symptoms from the favorite foods they are eating. They ask, how could a food that makes me feel good when I eat it, make me sick 3 or 4 hours later? To most people, this is unbelievable. Physicians are, equally with their patients, resistant to accepting maladaptive reactions to foods as a cause of their symptoms. The physician is taught to look everywhere else than foods and also if it is foods there is likely little or nothing that can be done about it, thus, symptoms produced by maladaptive reactions to foods is a grossly neglected area in therapeutic medicine.

A significant aspect of this dilemma of dismissing food reactions as causes of acute symptoms and degenerative diseases is inherent in the change that occurred in the 1920's when antibodies and complement disorders were discovered. Up to that time, an allergic reaction was simply a symptom production by an exposure to a substance. After this discovery of isolatable immune mechanisms as an explanation for allergy, allergic reactions lost their mystery. They went from no known cause to known immunologic causes. In terms of symptoms from food reactions, those without discernable immunologic

Medical data is for informational purposes only. You should always consult your family physician, or one of our referral physicians prior

factors were dismissed as imaginary or psychosomatic and so forth. Only in more recent years, has there emerged evidence of non-immunologic causes of symptoms from foods. These are now being referred to as non-immunologic sensitivities or addictions. The resistance to accept food reactions as the cause of symptoms remains only in the minds of patients and physicians alike.

In the 1940's, Albert Rowe, M.D., Allergist, of San Francisco, observed the relationship of non-immunologic food reactions producing symptoms. He used an initial avoidance followed by a rotation diet to handle these symptoms. In 1950, I attended, along with a dozen other senior medical students, a presentation by Alfred Rouse, M.D., an Allergist. He presented a case of a woman who became anxious when given a specific food. He asked our class, "What is the diagnosis?" I was studying medicine with the specific intention of becoming a psychiatrist. I answered his question with, "This is an anxiety neurosis." He rejected my diagnosis and to my surprise, maintained pleadingly, that an allergic reaction was involved. At the time, all I obtained from this was that he had ideas that were different than most of my instructors and therefore, I dismissed his hypothesis.

In 1952, while a resident in psychiatry, I read a book written by Walter Alvarez, M.D. entitled, *The Neuroses*. I was interested in what this honored internist at Mayo Clinic was saying about neuroses. Surprisingly, he devoted several pages to describing headaches, dulled brain function and emotional reactions to many different types to food reactions. At the same time in my residency training, all of my instructors were completely ignoring these possibilities. At the time, I thought Dr. Alvarez had made a fool of himself. He wasn't a psychiatrist. Why would he be drawing all of these conclusions that had a bearing on psychiatry?

In 1966, my friend Joseph Wolpe, who is referred to as the father of behaviorism, sent me a paper by Theron G. Randolph, M.D. In this paper, Dr. Randolph described fasting patients for five days and when feeding them meals of single foods, many symptoms emerged including the major symptoms of schizophrenia, manic-depression and neuroses. At the time, I thought this was impossible and I set the paper aside. It was four years before I read this paper again.

In 1970, I was a consultant to a school treating adolescents who were socially and educationally disadvantaged. Saul Klotz, M.D., Allergist, proposed that we do a double-blind study on these patients to see if any of their symptoms related to food reactions. This double-blind study was overwhelmingly positive, and from this I was encouraged to initiate a five-year study into the relationship between reactions to foods, chemicals and inhalants to mental symptoms. This resulted in my book, *Brain Allergies*. I was encouraged to do this project by Theron G. Randolph. I reviewed the writings of Herbert Rinkle, Frederick Spears, Walter Alvarez, Howard Rappaport and others. Marshall Mandell spent one day a week for five years supervising my examination of my patients. I followed Theron G. Randolph's method of fasting for five days followed by test exposures to single foods for the next month. The evidence was overwhelming. This study confirmed the allergists who had made observations of the emergence of emotionally and even mentally disordered symptoms due to food reactions, chemicals and inhalants.

Quite unexpectedly, I made another observation that resulted in my book, *Victory Over Diabetes*. The maturity-onset diabetic patients among my mental patients, not only had the

clearance of their mental symptoms but also the reversal of their diabetes. It became clear that maturity-onset; non-insulin type diabetes mellitus is the product of food addiction. John Potts followed up on this with four excellent statistical studies all of which were published in the abstract issue of the *Journal of Diabetes*. There then followed what to me is a strange phenomenon. Even though this work was done the right way and published in the right place, it had no serious impact on the practice of medicine. Here I had demonstrated conclusively that maturity onset diabetes is due to food addiction and that a 4-Day Diversified Rotation Diet routinely reversed diabetes mellitus and that following such a diet prevented the development of diabetes mellitus. Yet, it was virtually ignored. This again, shows how difficult it is to establish a new system of therapy. You are met with all the resistance of the already established method, even though a new method is demonstrated to be superior.

It is a strange phenomenon that in spite of this knowledge about maladaptive reactions to foods and the role of addiction in these foods, we still have numerous diets to reduce weight or to treat diabetes, which ignore food addiction as the driving force of the compulsion to eat specific foods and overeat. Diets that do not honor and properly treat food addiction drives the person, first of all, into the early stage of the diabetes mellitus disease process such as hypoglycemia and the later stage of hyperglycemia given the diagnostic name of diabetes mellitus type II. Properly engineered, the 4-Day Diversified Rotation Diet with the help of magnets initially relieves the symptoms of addiction so the person is comfortable while overcoming their addiction, help in retraining the compulsion to overeat will not only manage obesity but also prevent or reverse type II diabetes mellitus. It is known that approximately 80% of patients, at the time they are diagnosed as having maturity onset-type diabetes mellitus Type II, are obese. It was interesting for me to observe that the reversal of the diabetes mellitus in my patients was not dependent on weight reduction. The diabetes mellitus disappeared within five days as soon as the subject had gone through the food addiction withdrawal phase. There was, at that time, no time for weight reduction to have occurred. Obesity is a stress and should be reversed but it is not obesity as such that makes the person diabetic. It is food addiction.

THE THERAPEUTIC SIGNIFICANCE OF NEGATIVE MAGNETIC POLARITY AND NEGATIVE ION POLARITY HOW NEGATIVE IONS ARE FORMED IN NATURE

The atmosphere, and even within biological systems, is flooded with free static field electrons. There are electromagnetic conditions both in the atmosphere and within biological subjects which turn these static electrons to have either a positive or a negative polarity. In the positive polarity, the electrons are spinning clockwise. In the negative polarity, the electrons are spinning counter-clockwise. The activated electrons attach to particles that are available and produce ions, either positive or negative. Before and during a storm, the atmosphere is flooded with positive ions. The biological response of both animals and people to these positive ions is well-documented as producing tension, anxiety, depression and in cases of predisposed illnesses, physical or mental, the symptoms of the illness are worsened. After a storm is over, then the atmosphere is flooded with negative ions in which both animals and people respond with a sense of comfort and symptom-reduction.

In many parts of the earth, there are waters that have been known for their healing value. A volcanic mountain is a negative magnetic field and is in fact, a magnet. The volcanic mountain is a negative

Medical data is for informational purposes only. You should always consult your family physician, or one of our referral physicians prior

magnetic field and the molten mass beneath the volcano is a positive magnetic field. Water that filters down through the volcanic ash of this negative magnet mountain carries a negative ion charge. Characteristically, there are 70+ minerals that are low atomic weight minerals which become negative ions in which negative counter-clockwise spinning electrons attaches to the minerals. This is a stable situation in which when the water with its minerals is removed from the mountain, it remains composed of negative ions. At this same time, the water is always alkaline and is micro water in which the water is in smaller units than water that does not have negative ions. It is important to observe that a volcano and its molten mass below is indeed a magnet, the same as the magnets that are made industrially with negative and a positive magnet field. It is important to note that this negative magnetic field itself of the negative pole of the volcanic mountain charges the low atomic weight minerals to be negative ions. In the same order the negative magnetic field of an industrially produced magnet makes negative ions.

HOW NEGATIVE IONS ARE FORMED BY ION GENERATORS AND BY STATIC MAGNET- FIELDS

Electrolysis-type ion generators can be arranged to release into the air only negative ions. Thus a house can be flooded with negative ions with health values. The negative magnetic field of a static field magnet can be used to produce negative ions. The negative magnetic field of a static field magnet activates electrons to be spinning counter-clockwise. Although the magnet field is static, the electrons in the field are activated and thus are not static. Thus, a static negative magnetic field is indeed an energy field with movement spinning of the electrons in that field. A negative magnetic field is a source of electro magnetic energy in terms of a biological response. Thus, sitting a glass of water on the negative magnetic field of a static field magnet will electromagnetically charge up the water to have negative ions of both the mineral content and other particles in the water. Placing nutrients on the negative magnetic field of a static field magnet will charge up the nutrients to be electromagnetic charged negative ions.

THE SIGNIFICANCE OF NEGATIVE MAGNETIC POLARITY OF A STATIC FIELD MAGNET AND NEGATIVE IONS IN WATER, AIR AND NUTRIENTS NEGATIVE ION CHARGED

The biological response to a negative electromagnetic polarity, whether from a static field magnet or negative ions is that of alkaline-hyperoxia. The biological response to a positive static magnetic field and positive ions is acid-hypoxia. Much is known of the significance of alkaline-hyperoxia maintaining health and acid-hypoxia toxicity producing degenerative diseases. It is health-promoting for us to drink water from a natural source such as the volcanic source which has turned the water into alkaline micro negative ion water or the water treated by an electrolysis unit producing alkaline micro negative ion water or placing the water on the negative field of a static field magnet. It is wise to flood the air of our homes with negative ions from a negative ion generator. It is health-promoting and disease-reversing to use all sources of negative magnetic fields and negative ions to keep ourselves well and reverse our acid-hypoxic toxic diseases.

The negative magnetic field of a magnet provides the optimal therapeutic value for body treatment. Treatment of air, water and nutrients are a valuable adjunct to magnet therapy.

Negative electromagnetic polarity is the energizer of oxidoreductase enzymes which make adenosine triphosphate which is the body's central enzyme energizer and the central metabolic detoxifier.

STATIC MAGNETIC FIELD SOURCES FOR PRODUCING NEGATIVE IONS OF WATER AND NUTRIENTS

(See *Polar Power Magnets Catalog*)

- One 4" x 6" x 1/2" ceramic block magnet. This is a flat surface static field magnet with positive and negative magnetic polarity on opposite sides.

USES:

On the negative magnetic pole side, place water (municipal treated or ground water) and nutritional supplements for a minimum of five minutes. The longer, the better.

There are many other uses for this 4" x 6" x 1/2" magnet such as heart treatment for atherosclerosis, treating aches and pains, inflammation, spinal treatment, local infections, local cancers and much more. See my Magnet Therapy book and my quarterlies.

Cost:	\$ 49.95
Shipping:	8.50
	\$ 58.45

- Ceramic disc magnets of 1-1/2" x 1/2". These magnets are provided as Soother One which has two 1-12" x 1/2" disc magnets and a band, 2" x 26". These discs have positive and negative magnetic fields on opposite sides.

USES:

The negative magnetic pole of the disc can be used to produce negative ions of water and nutrients.

There are multiple uses for the two discs and wrap such as bitemporal placement for headaches and relief of emotional and mental symptoms, aches and pains, inflammation and small local infections and small local cancers.

See my writings for further details.

COST:

Soother One	\$ 21.95
Shipping	8.50
Total	30.45

**William H. Philpott's
MAGNETIC THERAPY MOTTO:**

I do not claim that magnets cured you; you claim that magnets cured you.

Even without being promised a cure, magnetic therapy is worth a try!

THE DEFINITION OF MAGNETIC POLARITY AS USED IN HUMAN PHYSIOLOGY

A magnetometer is used to identify positive (+) and negative (-) magnetic poles. A magnetometer is a scientific instrument, which identifies magnetic polarity in terms of electromagnetic polarity, which is positive (+) and negative (-) rather than the geographic compass needle identification of north and south. When using a compass to identify magnetic poles, a north seeking compass needle identifies a negative magnetic field of a static field permanent magnet. The north-seeking needle of a compass is magnetic positive and therefore points to (seeks) the magnetic negative north pole of the earth and also the magnetic negative magnetic field of a static field permanent magnet. The south-seeking needle of a compass is magnetic negative and therefore points to (seeks) the magnetic positive south pole of the earth and also the positive magnetic field of a static field permanent magnet.

Static field permanent magnets can properly be characterized as DC magnets because they are magnetized by a direct electric circuit current in which the positive electric pole produces a positive magnetic field and the negative magnetic pole produces a negative magnetic field. Those magnetically charging magnets from a DC electric current understand this relationship. Robert O. Becker, M.D., prefers to use the term DC magnets as applied to static field permanent magnets.

In 1600, William Gilbert (*DE MAGNETE*) was the first to point

Medical data is for informational purposes only. You should always consult your family physician, or one of our referral physicians prior out that the navigator oriented himself with the compass needle pointing toward north, which he called north, when in fact the compass needle pointed north is a south magnetic field.

Several scientists throughout the years have identified this error in naming the magnetic poles. This error in identifying poles still persists as tradition.

The physicist, B. Belaney (*New Encyclopedia Britannica* 1986. Vol. VIII, pages 274-275) again identified this geographic error in identifying magnetic poles and termed it "semantic confusion". To avoid this semantic confusion, he recommended using the electrical polarity definition of positive (+) and negative (-) as applicable to magnetic poles in which a positive electric pole (+) is also a positive magnetic pole (+qM) and a negative electric pole (-) is also a negative magnetic pole (-qM). "M" stands for magnetism.

The body is an electromagnetic organism with a direct current (DC) central nervous system in which the brain with its neuronal bodies is a positive magnetic field and, also produces a positive electric field. The extensions from the neuronal bodies are a negative magnetic field and also produce a negative electric field. The human body does not have a storage battery from which electricity flows or an electric dynamo from which electricity flows. Rather, by a mechanism comparable to a magneto, the human body turns its magnetic fields into DC electric current. It is also true that each cell of the body has a positive and negative magnetic field in its DNA. Since the human body functions on a DC electromagnetic circuit, it is especially appropriate to use the positive (+) and negative (-) identification of magnetic polarity when relating magnetism to the human body. The human body does not have a north and south poled field, but rather has positive and negative magnetic fields from which electricity is produced. A geographic definition not applicable to human physiology whereas, an electromagnetic definition of magnetic polarity is essential. If and when the geographic definition of polarity is used, it still requires a translation into usable terminology for application to human physiology.

For the above reasons the definitions of positive (+) and negative (-) magnetic fields are used when applying magnetics to human physiology. The traditional compass needle oriented naming of magnet poles is included in brackets as negative (south-seeking) and positive (north-seeking).

There is a need to understand the navigational error in identifying the magnetic poles as well as the parallel identification in identifying DC electrical current poles and DC static field permanent magnet poles made from the DC current. To those who have examined for and identified the distinctly opposite biological responses to opposite magnetic fields, the separate identification of the magnetic poles is an important must. To those not experienced in the knowledge of separate biological responses to opposite magnetic poles, the magnetic poles and the gauss levels needed for these responses is what is making biophysics become a predictable science parallel to the predictable industrial application of magnetics.

STATUS OF THERAPEUTIC MAGNETISM

Since Ancient times, the beneficial biological response to magnetism has been praised by a few and doubted by a large number. The magnetic force at a distance that could not be seen leads to doubts of magnetism biological responses. The development of the compass produced a general acceptance of the actuality of the existence of magnetism. During the past two hundred years, the interest in the therapeutic value of magnetism has experienced considerable fluctuations.

The physicist, Albert Roy Davis' observations of the opposite biological response to opposite magnetic poles, set the stage for understanding there were two biological responses to magnetism. It is now known biological response to separate magnetic poles can

be as predictable for biological responses as the use of electromagnetism used in our industrial world. It is now understood the magnetism functions at the atomic level with the movement of electrons which influence biological function. The positive magnetic field (traditional north-seeking pole) spins electrons clockwise while the negative magnetic (traditional south-seeking pole) spins electrons counterclockwise. These opposite electron spins from opposite magnetic poles provides predictable opposite biological response. The biological response to the positive magnetic field is acid-hypoxia. The biological response to the negative magnetic field is alkaline-hyperoxia.

Robert O. Becker² documented the separateness of the positive (north-seeking) and negative (south-seeking) magnetic fields. The positive (north-seeking) magnetic field is the signal of stress injury. The negative (south-seeking) magnetic field governs healing and normalization of biological functions. In terms of neuronal response, the positive (north-seeking) magnetic field is exciting and when sufficiently high such as during sun flares, can even precipitate psychosis in those so biologically predisposed. The negative (south-seeking) magnetic field is neuronal calming and encourages rest, relaxation, sleep and when sufficiently high in gauss strength, can produce general anesthesia. Robert Becker anesthetized his small experimental animals with a negative (south-seeking) magnetic field.

My research has abundantly confirmed these observations of Albert Roy Davis and Robert O. Becker. As a neurologist, I documented by EEG that a positive (north-seeking) magnetic field is neuronally exciting. The higher the gauss strength, the higher the excitement. A sufficiently high positive (north-seeking) magnetic field can evoke seizures in those so predisposed. A negative (south-seeking) magnetic field is neuronal calming. The higher the gauss of the negative (south-seeking) magnetic field, the slower the brain pulsing on the EEG. This information sets the stage in understanding how a negative (south-seeking) magnetic field controls neuronal excitement in neurosis, psychosis, seizure potential, addictive withdrawal and movement disorders. not applicable to human physiology whereas, an electromagnetic definition of magnetic polarity is essential. If and when the geographic definition of polarity is used, it still requires a translation into usable terminology for application to human physiology.

For the above reasons the definitions of positive (+) and negative (-) magnetic fields are used when applying magnetics to human physiology. The traditional compass needle oriented naming of magnet poles is included in brackets as negative (south-seeking) and positive (north-seeking).

There is a need to understand the navigational error in identifying the magnetic poles as well as the parallel identification in identifying DC electrical current poles and DC static field permanent magnet poles made from the DC current. To those who have examined for and identified the distinctly opposite biological responses to opposite magnetic fields, the separate identification of the magnetic poles is an important must. To those not experienced in the knowledge of separate biological responses to opposite magnetic poles, the magnetic poles and the gauss levels needed for these responses is what is making biophysics become a predictable science parallel to the predictable industrial application of magnetics.

SINGULAR BIOLOGICAL RESPONSE TO SINGULAR MAGNETIC POLE FIELDS

There is a classic traditional mechanical magnetic model from which there is a predicted two magnetic pole effect from a single magnetic pole field. In this model, the magnetic field radiates out from the singular magnetic pole of a magnet and turns back to join the opposite pole. The traditional assumption is that when the mag-

Medical data is for informational purposes only. You should always consult your family physician, or one of our referral physicians prior netic field changes direction going backward towards the magnetic field on the other side (other pole) of the magnet that this changed direction is the opposite magnetic pole.

I have prepared magnetic fields honoring this assumption that there are of necessity both magnetic poles on the same side of the flat surfaced plate-type magnet with poles on opposite sides of the flat surface. I have compared this with the assumption that there is a single magnetic field on opposite sides of a magnet. I have not demonstrated by biological responses including brain wave (EEG) responses that there are two opposite magnetic fields on one side of the magnet. Consistently, I have observed a single magnetic pole biological and EEG response to single magnetic fields of flat surfaced magnets with poles on opposite sides of the flat surface.

There is another non-traditional magnetic mechanical model that states that the magnetic poles change at the equator by rotating 180 degrees (minor image). Obviously, in the case of the earth, the magnetic fields change at the equator producing a northern hemisphere of a negative (south-seeking) magnetic field and a southern hemisphere of a positive (north-seeking) magnetic field. This model indicates that the magnetic field radiating up from the negative (south-seeking) magnetic field of the magnet as well as the magnetic field that buckles back to the opposite side of the magnet are both a negative (south-seeking) magnetic field and only become the opposite magnetic pole field when it enters the half-way point of the magnet (equator).

Even though a static magnetic field does not move, it still is an energy field by virtue of the fact that electrons are moved by the static magnetic field. The negative (south-seeking) static magnetic field rotates (spins) electrons in that field counter-clockwise. A positive (north-seeking) static magnetic field rotates (spins) electrons in that field clockwise. The movement of electrons in a static magnetic field is called the Aharonov-Bohm electromagnetic potential. Akaira Tonomura has also confirmed this. This change in rotation between the positive (north-seeking) and negative (south-seeking) magnetic fields occurs at the equator of the magnets and not at the point where the magnetic field turns back toward the opposite magnetic field. This magnetic mechanical model agrees with the clinical response evidence of the magnetic field being a full individual field on each side of the magnet.

The magnetic field remains the same pole whether directly above the magnet or the magnetic field that is turning back toward the opposite side. If it did become the opposite pole when it turned back, it would then not proceed to the opposite side. This is true since the same poles repels. Therefore, it has to remain the negative (south-seeking) pole that buckles back toward the positive (north-seeking) magnetic field. This being true, the pole cannot change until it reaches the equator in the magnet between the two poles. An example is that in the case of the earth's magnetic field. The south pole (+) goes toward the north pole (-) and changes polarity at the earth's equator.

(See Depth of Penetration/Gauss Field Strength, Page 4)

MAGNETIC FIELDS BIOLOGICAL RESPONSES UNIVERSAL TRUTHS

Magnetic biological responses are universally the same under any and all sections of the body tested and both of earth's magnetic hemispheres.

1. Centrad and centrifugal atomic energy expressions.

At the atomic level, the counter-clockwise rotation pulls electrons toward the center proton (centrad) while the clockwise rotation of electrons pushes outward from the center proton (centrifugal).

Therefore, there are no free radicals in a negative magnetic field with a counter-clockwise spiral spin of electrons pulling to-

ward the center. Thus, a negative magnetic field is a biological anti-stress, anti-inflammatory response.

There are free radicals in a positive magnetic field with a clockwise spiral spin of electrons pushing away from the center. Thus, a positive magnetic field is a biological stress-inflammation response.

2. Centrad and centrifugal weather energy expressions.

In the northern magnetic hemisphere of the earth the energy expression of counter-clockwise spiral spinning of electrons is with energy expression being toward the center.

In the southern magnetic hemisphere of the earth the energy expression of the clockwise spiral spinning of electrons is with the energy expression being away from the center.

Varied colliding wind streams with varied temperatures and varied pressures can override the earth's natural occurring hemispheric magnetic polarities and produce a local magnetic field opposite to the earth's hemispheric magnetic field. In any event, wherever it is in the earth's hemispheric magnetic field, a counter-clockwise rotation energy pulls toward the center (centrad) and clockwise rotation energy pushed away from the center (centrifugal).

3. The Neuronal pulsing frequency relationship to neuronal magnetic field strength.

The brain's response to a negative magnetic field is a decreasing of the pulsing frequency of the brain relating specifically to the gauss strength of the magnetic field. The higher the gauss strength is the slower the pulsing magnetic field. With a positive magnetic field, the higher the gauss strength, the faster the pulsing field. This reveals that a negative magnetic field is anti-stress and the positive magnetic field is biological stress.

It also holds that the pulsing frequency of the brain can be driven by an external pulsing field using sight, sound, tactile or brain stem with the pulsing field being placed on the upper back of the neck and low occipital. The pulsing field can drive the magnetic field of the brain. Pulsing fields of 12 cycles per second and less evoke a brain negative magnetic field. The intensity of the pulsing determines the gauss strength of the pulsing field. The pulsing field plus the intensity of the pulsing field determines the magnetic behavioral state of the brain. Eight to twelve cycles per second are relaxation. Six cycles per second is relaxation. Four cycles per second is dissociation. Three cycles per second is lapse states. Two cycles per second is sound sleep. One cycle per two seconds is harmless general anesthesia.

4. A 3-dimension spiral electron spin is provided by magnetic fields.

In electromagnetic physical nature, the 3-dimensional spiral is frequently expressed. This 3-dimensional spiral is present in the light refractory levo (left) substances and dextro (right) substances. These are 180-degree mirror image isotopes. Magnetism has the same levo (left) and dextro (right) 3-dimensional spiral spin of electrons, the same as the levo and dextro substances in relationship to light. The biological effects are opposite as to the separate energy manifestations. In the case of amino acids and fats, only the levos have nutritional value. In the case of magnetism, the levo (left spiral electron spin) is an anti-stress, healing and normalizing counter-stress correction from the biological stress dextro (right spiral electron spin).

5. A positive magnetic field is stressful and therefore, does not heal the human body.

6. A positive magnetic field is biologically stressful, raises endorphins and with frequent use, is addicting.

7. A negative magnetic field is biologically anti-stress, does not raise endorphins and is not addicting.

8. A negative magnetic field is anti-stressful and governs human cellular normalization and healing.

Medical data is for informational purposes only. You should always consult your family physician, or one of our referral physicians prior

9. A negative magnetic field governs sleep by evoking melatonin production by the pineal gland.

10. A positive magnetic field blocks the production of melatonin by the pineal gland.

11. A positive magnetic field biological response is acid-hypoxia.

This is compatible with the metabolism of microorganisms and cancer and not compatible with human metabolism.

12. A negative magnetic field biological response is alkaline-hyperoxia.

This state is necessary for human metabolism and is not compatible with the metabolism of microorganisms and cancer.

13. A positive magnetic field biological response is vasodilatation and acid-hypoxia.

This makes it unsuited for the treatment of edematous and bleeding areas from acute injuries.

14. A negative magnetic field biological response is alkaline-hyperoxia, and due to the hyperoxia, makes it useful for stopping the bleeding of acute injury, is not vasodilating and resolves the edema of acute injuries.

15. The positive magnetic field acid-hypoxia, in short-term exposure of minutes to a few hours, produces an inflammatory red, raised, edematous area due to the acid-evoked vasodilatation inflammatory reaction.

16. The positive magnetic field acid-hypoxia continuous long-term exposure of a week to two weeks reveals in fact, an acid-evoked inflammatory vasculitis (acid-burn), which is red, raised, edematous and itching with bacterial growth pustules.

17. The acid-hypoxia biological response to a positive (north-seeking) magnetic field activates the acid-dependent transferase enzyme catalysis of fermentation production of adenosine triphosphate for microorganisms (viruses, bacteria, fungi, parasites) and cancer cell metabolism which also replaces the alkaline-hyperoxia necessary for oxidation-reduction enzyme catalysis production of ATP necessary for human cell metabolism.

18. The alkaline-hyperoxia biological response to a negative (south-seeking) magnetic field activates the alkaline-dependent oxidoreductase enzyme catalysis of oxidation-reduction production of ATP necessary for human cell metabolism which also replaces the acid-hypoxia necessary for microorganisms and cancer cell metabolism.

19. A negative magnetic field activation of alkaline-dependent oxidoreductase enzymes in an alkaline medium processes (detoxifies) the biological inflammatory free radicals, peroxides, acids, alcohols and aldehydes to non-inflammatory water and molecular oxygen.

20. A sustained positive (north-seeking) magnetic field acid-hypoxia sustains the necessary life energy of microorganisms and cancer cells and destroys the necessary life energy of human cells.

21. A sustained negative (south-seeking) magnetic field alkaline-hyperoxia sustains the necessary life energy of human cells and destroys the necessary life energy of microorganisms and cancer cells.

22. Cancer cells have a positive magnetic field charge.

23. Normal human cells have a negative magnetic field charge.

24. Microorganisms have a positive magnetic field charge by virtue of their high mineral content with a high conductance and thus stressful higher pulsing frequency whereas human cells with lower mineral content and lower conductance

has a non-stressful low pulsing frequency.

25. The biological response to a magnetic field is determined by the 3-dimensional spiral rotation spin of the electrons in the magnetic field and not by the directional approach of the magnetic field to the biological specimen.

a) Therefore, a flat-surfaced, static field magnet with magnetic poles on opposite sides, has a separate, distinct magnetic field over each side.

b) The directional change of the magnetic field turning back around the sides of the magnet to the opposite pole side, does not change the magnetic polarity electron spin until it reaches the halfway point (equator) between the magnetic fields for the magnet.

c) A unidirectional magnetic field is not necessary to maintain a separation of magnetic fields. The 3-dimensional spiral electron spin and not the direction approach to the biological specimen determines the separate biological response to opposite magnetic fields.

26. IMMUNOLOGIC RESPONSES TO OPPOSITE MAGNETIC FIELDS

A. Substance +
Positive magnetic field>sensitization.

Dead or attenuated
microorganism+
Positive magnetic field>sensitization.
(vaccination)

B. Substance to which subject is immunologically reactive +
Negative magnetic field>desensitization.

27. ENZYMATIC RESPONSE TO OPPOSITE MAGNETIC FIELDS

A. Food substrate +
Oxidoreductase enzymes
+ Negative magnetic field> ATP +oxidation
remnant magnetism
(Negative magnetic field)

B. Food substrate +
Oxidoreductase enzymes +
Positive magnetic field>No ATP production
and no oxygen
or water production

C. Substrate
(free radicals, peroxides,
acids, alcohols and aldehydes) +
oxidoreductase enzymes +
negative magnetic field>oxygen and water

D. Substrate
(free radicals, peroxides,
acids, alcohols and aldehydes) +
oxidoreductase enzymes +
No oxygen and no water
positive magnetic field>produced

Medical data is for informational purposes only. You should always consult your family physician, or one of our referral physicians prior endorphins and serotonin, microorganisms and cancer cell replication.

E.
Food Substrate +
Acid dependant transferase enzyme + ATP by fermentation +
Positive magnetic field.....>positive remnant magnetism

28. HEAVY METAL DETOXIFICATION

Heavy metals are all electro-positive. Heavy metals produce acidity and metabolically damaging free radicals and acids. Heavy metals biologically damage by attaching to (complexing) biological macromolecules.

A negative magnetic field replaces the electro-positivity of heavy metals with an electromagnetic negativity and thus blocks, reverses and detoxifies heavy metals, tissue complexing, free radicals, and acid production. In the presence of a maintained static negative magnetic field heavy metals are dispersed of in the urine in a non-toxic state.

A.
Toxic electro-positive
heavy metals
(aluminum, mercury,
lead and other heavy metals)
+ a sustained static negative
magnetic field attached
to the heavy metal.....>Dispersed of in the urine as non-toxic
electro-negative metal

29. POSITIVE MAGNETIC FIELD NEUROPATHY

The acid-hypoxic response to a positive magnetic field placed over a nerve trunk produces a peripheral neuritis of tingling, numbness, pain, loss of motor function, loss of sense of pressure, etc. This can begin to occur within 3-4 hours of continuous exposure to a positive magnetic field.

30. NEGATIVE MAGNETIC FIELD HEALING OF NEUROPATHY.

The alkaline-hyperoxia response to a negative magnetic field exposure reverses positive magnetic field neuropathy, toxic neuritis, dialectic neuropathy, etc.

31. OPTIMIZING THYMUS GLAND DEFENSE

The biological stress of a positive magnetic field can be used to optimize thymus gland functions against infections and cancer. Due to the acid-hypoxia evoked by the positive magnetic field the external exposure to this magnetic field should not exceed 1/2 hour, periodically. This same principle of short duration exposure to the positive magnetic field applies to increased hormonal production to catabolic hormone glands such as the adrenals.

32. CAN APPLICATION OF THE POSITIVE MAGNETIC FIELD BE HARMFUL?

The FDA has classified magnetic field application to humans as "not essentially harmful." This 'not harmful' classification of magnetic field application to humans is a half-truth. This 'not harmful' classification occurred due to the pre-market testing for the MRI. The short duration of MRI scan exposure to both the positive and negative magnetic fields is not harmful. However, objective observations by several physicians has demonstrated the following:

A. A brief exposure to a positive magnetic field is not harmful and can be used to stimulate the thymus gland function, adrenal-cortical hormone increase, stimulate a return of neuronal function that have been inhibited by pressure, etc.

B. Prolonged exposure to a positive magnetic field can produce a toxic vasculitis, neuritis, and addiction due to evoked

C. A negative magnetic field is never harmful and helps healing, repairs, increases melatonin and growth hormone production and produces biological homeostasis.

33. MAGNETIC FREE ENERGY.

A static magnetic field is the energy essence of magnetic therapy.

Oxidoreductase enzyme + alkaline-hyperoxia
Food substrate.....>ATP
plus
plus electron free energy from static electric catalytic remnant
field with movement of electrons between magnetism substrate
and enzyme producing a negative (Negative magnetic field)
magnetic field (magnetic free energy)

Negative magnetic field therapy provides magnetic free energy from a static negative magnetic field for alkaline-hyperoxia catalytic reactions.

34. Each side of a static field magnet with magnetic fields on opposite sides of a flat surface magnet produces only a single uniform, magnetic field.

From each single side of a flat surface static field magnet, there is a magnetic field of the same magnetic polarity field turning back to enter the opposite magnetic field. This entry into the opposite magnetic field occurs at the edge of the magnet at the equator which is a half-way point between the opposite magnetic fields. Thus, a subject being exposed to the uniform negative magnetic field of a flat surface magnet receives the negative magnetic field only and does not receive a positive magnetic field coming around the edge of the magnet. The entry of the positive magnetic field is at the equator half-way point between the opposite magnetic fields. This is on the edge of the magnet and not on the opposite flat surface side of the magnet.

Albert Roy Davis, Physicist, for several years used flat surface magnets with poles on opposite sides to determine the separateness of the opposite biological response to the positive and negative magnetic fields. This separate biological response to opposite magnetic fields could not have occurred if there was an opposite magnetic field coming around the edge of the magnet.

Robert O. Becker, M.D. understood that a flat surface magnet with opposite magnetic fields on opposite sides provided only a separate single magnetic field form each side of the flat surface magnet.

Skin tests prove that only a single magnetic field response occurs in response to the single magnetic field on each side of a flat surface magnet. A gauss meter reading documents evidence that only a single magnetic field occurs from a flat surface magnet with poles on opposite sides and that there is not an opposite magnetic field coming around the edge of the magnet. The usefulness of a magnetometer is limited to the reading over the uniform magnetic field over the flat surface of a flat surface magnet with magnetic field poles on opposite sides. The reason for this is that the magnetometer has its own magnetic field which will give an opposite reading when crossing over the edge of the magnet, due to the fact that the bar magnet in the magnetometer reaches beyond the equator at the edge of the magnet.

The erroneous concept model that an opposite magnetic field comes around the edge of a flat surface magnet comes from an incorrect use of a magnetometer, contrary to the manufacturers stated value and limitations of a magnetometer which is "limited to a uniform field".

There is no reason to place mini-block magnets under a 4"

Medical data is for informational purposes only. You should always consult your family physician, or one of our referral physicians prior mattress pad in order for the surface to receive only a negative magnetic field. When placing mini-block magnets in a bed pad on top of a mattress it is necessary to sufficiently pad between and over the mini-block magnets so the weight of the subject cannot press down between the magnets so as to not reach the equator half-way point between the separate magnetic fields on opposite sides of the mini-block magnets.

The Physiology of Biomagnetics

Humans and all living organisms are electromagnetic. Human life exists as an electromagnetic organism. The central nervous system and the peripheral nervous system function as a direct current circuit with a positive (north-seeking) magnetic field at the positive electric pole and a negative (south-seeking) magnetic field at the negative electric pole. Each cell has its positive (north-seeking) and negative (south-seeking) magnetic fields. The DNA genetic code material of each cell has both positive (north-seeking) and negative (south-seeking) magnetic fields. Magnetic fields govern cell functions and is a necessary functional part of all physiological functions of the human body. Biomagnetics needs to be understood in order to understand the normal mental and physiological energy functions of the human body. Biomagnetics needs to be understood in order to understand how handicapping symptoms develop and also how to reverse these handicapping symptoms. Magnetic energy dynamics is the very foundation of normal and abnormal mental and physical human functions. Magnetic therapy employs the basic fundamental energy dynamics of being alive and responding to stimuli whether these are internal brain thoughts or feelings or an external play on sight, sound or tactile senses. Magnetic field energy, due to being the very energy foundation of response, can alter the biological responses to stimuli.

There are distinctly separate fundamental ways in which magnetic fields exert control over responses to stimuli.

Biological Responses to Separate Magnetic Fields:

<i>Positive Magnetic Field</i>	<i>Negative Magnetic Field</i>
Stress response	Anti-stress response
Neurone exciting	Neurone calming
pH acidifying	pH alkalinizing

Human physiology has a homeostatic function between the positive (north-seeking) magnetic field biological governed biological responses and a negative (south-seeking) magnetic field governed biological responses. The necessary biological homeostasis between a positive (north-seeking) and negative (south-seeking) magnetic field is not an equal amount of both of these fields. The negative (south-seeking) magnetic field has a higher gauss strength than the positive (north-seeking) magnetic field in the human body. The presence of a higher negative (south-seeking) magnetic field than a positive (north-seeking) magnetic field provides the human with the ability to exert a control over any possible excessive positive (north-seeking) magnetic field stimulus response. The neuron bodies of the central nervous system are a positive (north-seeking) magnetic field while the neuron axon extensions into the body are a negative (south-seeking) magnetic field.

Robert O. Becker demonstrated that an injury registers as an electromagnetic positive while the healing state of the injury registers electromagnetic negative. Healing-repair can only occur in the presence of a negative (south-seeking) magnetic field. A positive (north-seeking) magnetic field is the signal of injury sent to the brain following which the brain returns a negative (south-seeking) magnetic field necessary for healing-repair. Magnetic therapy provides an external source of a negative (south-seeking) magnetic field for healing-repair.

The human body can only maintain optimum life function in an alkaline medium. Human life is alkaline-hyperoxia-dependent.

The physicist, Albert Roy Davis discovered that a negative (south-seeking) magnetic field biological response is alkaline-hyperoxia while the positive (north-seeking) magnetic field biological response is acid-hypoxia. My observations confirm Davis' observation of an alkaline-hyperoxia response to a negative (south-seeking) magnetic field. The alkaline-hyperoxia biological response to a negative (south-seeking) magnetic field is why a negative (south-seeking) magnetic field relieves symptoms.

There is a parallel between acid-base balance and magnetic field levels. A biological acid state is always a positive (north-seeking) magnetic field. A biological alkaline state is always a negative (south-seeking) magnetic field. My research examined pH before and after test meals of foods and exposure to common environmental chemicals and also, immunologic reactions. When symptoms occurred during these tests of exposures an acidity always developed. These symptoms can be relieved by the negative (south-seeking) magnetic field of a static field magnet because the biological response to the negative (south-seeking) magnetic field is alkaline-hyperoxia.

pH Biological Response to Separate Magnetic Fields

<i>Positive Magnetic Field</i>	<i>Negative Magnetic Field</i>
--------------------------------	--------------------------------

Acid-hypoxia	Alkaline-hyperoxia
Magnetic Response to Stress Injury	
<i>Positive Magnetic Field</i>	<i>Negative Magnetic Field</i>

A positive magnetic field is a signal of injury sent to the brain.

The brain receives the signal of injury as a positive magnetic field and returns the signal of a negative magnetic field. Healing-repair requires alkaline-hyperoxia for oxidative phosphorylation production of ATP. A negative magnetic field biological response to a negative magnetic field is alkaline-hyperoxia.

No healing-repair can occur due to the positive magnetic production of acid-hypoxia.

The production of ATP by oxidative phosphorylation is blocked by the acid-hypoxia of a positive magnetic field.

Chronic stress, from whatever source, produces acidity. Since acidity ties up molecular oxygen, producing acids, the result is acid-hypoxia. Chronic stress resulting from physical injury or psychological stress have the same biological consequences of the production of acid-hypoxia. An injured muscle or over-stressed muscle becomes acidic and thus also hypoxic. This acid-hypoxic state is inflammatory and painful whether the tissue is a muscle, fascia, tendon or other tissues such as an internal organ.

The problem of inflammation and pain production by acidity becomes compounded since the human life energy (ATP) cannot be made in an acid-hypoxic medium since oxidative phosphorylation is alkaline-hyperoxia-dependent. However, human cells have the ability to make ATP by fermentation using transferase enzyme catalysis. The production of ATP by fermentation occurs when acid-hypoxia is present. This is an emergency energy measure and cannot sustain human life for very long. Lactic acid is a by-product of fermentation, which adds further acid-induced inflammation. Cancer cell initiation and growth can only develop in an acid-hypoxic medium since cancer cells use fermentation for the production of ATP. Infectious micro-

Medical data is for informational purposes only. You should always consult your family physician, or one of our referral physicians prior organisms are acid-hypoxic, fermentation-dependent for their production of ATP. A negative (south-seeking) magnetic field with its production of alkaline-hyperoxia canceling out acid-hypoxia is antibiotic, anti-parasitic and anti-cancerous.

Biological Source of Magnetism

Magnetic field energy is essential to biological life energy. Biological life cannot exist without magnetic field energy. The DNA genetic code contains magnetic fields and passes this magnetic field on to the next generation. Magnetic fields are always both positive (north-seeking) and negative (south-seeking) magnetic fields. However, these positive (north-seeking) and negative (south-seeking) magnetic fields do not have to be of equal proportions. In fact, the human magnetism is higher in the negative (south-seeking) magnetic field than the positive (north-seeking) magnetic field. This is how the human organism maintains alkaline-hyperoxia. Microorganisms', parasites' and cancer cells' magnetic physiology is opposite to the human magnetic physiology in which the positive (north-seeking) magnetic field is higher than the negative (south-seeking) magnetic field.

There are hundreds of enzyme catalytic reactions occurring in the human. A catalytic reaction requires movement of electrons between the substrate and the enzyme. When electrons move, they produce a magnetic field. Thus, alkaline-dependent enzymes are also negative (south-seeking) magnetic field dependent and acid-dependent enzymes are also positive (north-seeking) magnetic field dependent.

Examples of Biological Produced Magnetism

Four Oxidoreductase enzymes

Food Substrate _____>Adenosine triphosphate
 +alkaline-hyperoxia (ATP+ oxidative remnant magnetism; a negative magnetic field)

Food Substrate _____>ATP + a positive
 transferase magnetic field
 enzyme + acid-hypoxia

Secrets of Negative Magnetic Field Therapy

A negative (south-seeking) magnetic field is anti-stressful and thus, neuronal calming. A negative (south-seeking) magnetic field on the brain and spine calms neurones (anti-stress) and aids voluntary relaxation and sleep. It is also true that a negative (south-seeking) magnetic field can be made strong enough to produce involuntary magnetic general anesthesia. Robert O. Becker anesthetized his salamanders with a negative (south-seeking) magnetic field. I have demonstrated the control of seizures by a negative (south-seeking) magnetic field. I have demonstrated the control of movement disorders with a negative (south-seeking) magnetic field. I have observed the control of major mental disorders such as hallucinations, delusions and depression with a negative (south-seeking) magnetic field. The exceptional value of a negative (south-seeking) magnetic field control over neuronal excitation is that it works whether the neuronal excitation is due to an injured brain from trauma, viral infection, maladaptive food reaction, maladaptive environmental chemical reaction, immunologic reaction or repressed unconscious hostility, anger, anxiety and its associated somatic expression. The secret of a negative (south-seeking) magnetic field therapy is that a negative (south-seeking) magnetic field is neuronal calming, cellular metabolic normalizing, enzymatic processing of all types of inflammatory responses

no matter why they are present.

Symptom-producing responses occur due to repeated neuronal excitation paired with a stimulus evoked response. Sensitization is due to neuronal excitation paired with a stimulus. Desensitization results when neurones are held in a calm, anti-stress state while meeting the stimulus that had trained in a maladaptive sensitization response. It is repetition while exposed to a stimulus-producing response that trains in sensitivity and it is repetition while holding the neurones in an anti-stress inhibited state that trains out sensitization. Thus, a negative (south-seeking) magnetic field brain treatment has an immediate cancellation of the maladaptive response and by repetition trains out the maladaptive response. Local inflammation is reversed enzymatically by oxidoreductase enzymes processing of free radicals, peroxides, oxyacids, alcohols and aldehydes.

The Role of Magnetics In Enzyme Function

All biological enzyme functions (catalysis) in a living biological system are magnetic energized. There is a measurable catalytic remnant magnetism to enzyme function in live biological systems. Four oxidoreductase enzymes are needed to produce adenosine triphosphate (ATP) from foods. During these enzyme processes, there are two energies being made. One is ATP and the other is oxidation remnant magnetism. Both of these energies are used for the energy activation of enzymes. There are thousands of the enzymes, each with its own selective function. These are named according to their functions. Oxidoreductase enzymes are a family of enzymes with specific necessary functions. These enzymes have the following functional values. They produce ATP and catalytic remnant magnetism and they process the end-products of the metabolic process which are initially the free radical called superoxide which is oxygen with an added electron. If not rapidly enzymatically processed, it will produce peroxides, acids, alcohols and aldehydes all of which are enzymatically toxic, that is inflammatory-producing.

In order for us to understand biological life energy, we must understand the starting point of that energy. Thus, we must understand the functions of oxidoreductase enzymes. We have enzymes and the substrates which they are processing. In the case of producing ATP, the substrate is a food. In the case of processing the toxins or inflammatory producing substances, the substrate are the free radicals and the products they produce. There exists a natural ten-

Medical data is for informational purposes only. You should always consult your family physician, or one of our referral physicians prior dency for the enzyme and the substrate to join. These areas that have a biological attraction to join are called dipoles. However, this attraction all by itself does not produce enzyme action. These are simply the areas where the enzymes and the substrates do line up and join. Otherwise, there has to be an energy. This characteristicly comes from static electrons that are in the body. They help move the enzyme and the substrate together. Once they move, now a magnetic field is created because this is what a magnetic field is all about. It is produced by the movement of electrons. Also, a magnetic field from an external source that is a static magnet field will also produce the movement of electrons. This is why an external source of a static magnetic field will cause the enzyme and the substrate to join because it is moving electrons.

The essence of static magnetic field therapy is the energy activation of enzymes to join substrates for catalysis. In the case of oxidoreductase enzymes, they are alkaline-hyperoxia dependent and do not require ATP for energy activation but do require a static negative magnetic field energy for catalytic activation.

ATP is an energy activator of many enzymes. In alkaline-hyperoxia, ATP dependent enzyme catalysis, a negative magnetic field is a co-factor with ATP as an enzyme energy activator. This is all human enzymes other than those of the mouth and stomach.

In acid-hypoxia dependent enzymes as well as transferases, ATP and a positive magnetic field are energy co-factors. Invading microorganisms and cancer cells are acid-hypoxic dependent for making their ATP.

Thus, a static negative magnetic field strengthens the human cell alkaline-hyperoxic dependent energy state and defeats the acid-hypoxic dependent state of cancer cells and invading microorganisms (bacteria, viruses, fungi and parasites).

Magnetic Dynamics of The Degenerative Process

The central disorders of acute maladaptive reactions are: 1) acidity, and 2) oxygen deficit. Monitoring the biochemical disorders of chronic degenerative diseases reveals the same disorders as acute maladaptive reactions which is acid-hypoxia. Chronic degenerative diseases are observed to be acute maladaptive reactions extended in time to a chronic state with the resultant cellular damage. The contrast between the well cells of the healthy, functioning person and the sick cells of degenerative diseases provides valuable clues as to how magnetics can substantially aid in recovery of inflammatory degenerative diseases, infections from microorganisms and cancer.

In the process of oxidative phosphorylation producing adenosine triphosphate (ATP), molecular oxygen accepts an electron and becomes free radical oxygen (superoxide). If not immediately enzymatically reversed, superoxide proceeds to produce other free radicals, peroxides, oxyacids and aldehydes. These are all inflammatory. The oxidoreductase family of enzymes have the assignment of making ATP by oxidative phosphorylation and at the same time, processing the end-products of this oxidation phosphorylation process. This oxidoreductase family of enzymes are alkaline-hyperoxic-negative magnetic field activation dependent. When these 3 physiologically normal factors are not present, then cellular ATP is made by fermentation. The 3 factors necessary for fermentation to produce ATP are: 1) acidity, 2) lack of oxygen, 3) a positive static magnetic field as an enzyme energy activator. Human cells have the capacity to make ATP by either oxidative phosphorylation or fermentation. Cellular fermentation producing ATP only functions in the abnormal state of acidity and hypoxia. The enzymes catalyzing fermentation production of ATP are transferases which are acidhypoxic-positive-static magnetic field activation dependent. Sugar is catalyzed by transferase producing ATP, alcohols, acids

and carbon dioxide. Hydrolase enzymes catalyzes starches to sugars. Hydrolase also is acid-hypoxic-positive static magnetic field energy activation dependent.

A static magnetic field is the energy activator of all biological catalytic processes. When oxidative phosphorylation catalyzes the production of ATP this catalytic reaction makes negative static field magnetism termed oxidation remnant magnetism. This negative static magnetic field is available to energize oxidoreductase enzyme catalysis and at the same time, block transferase and hydrolase catalysis. Besides the biological available negative static magnetic field from oxidation remnant magnetism, there is an always present electrostatic field (1). In an alkaline medium the electrostatic field produces a negative static magnetic field which energizes oxidoreductase catalysis. In an acid medium, an electrostatic field produces a positive static magnetic field which in turn energizes transferases and hydrolases. Both oxidation phosphorylation and fermentation catalysis are static magnetic field energized. However, they are energized by opposite magnetic poles. Oxidation phosphorylation is energized by a negative static magnetic field in an alkaline-hyperoxic medium. Fermentation is energized by a positive static magnetic field in an acid-hypoxic medium. A static magnetic field is required for the enzyme and the substrate to attach. A static magnetic field present during enzyme catalysis has been documented (2). ATP made by fermentation with its acid-hypoxic medium cannot maintain human biological life energy. ATP made by fermentation can maintain the life energy of microorganisms such as bacteria, fungi, viruses, parasites and cancer cells. The secret to reverse acute maladaptive symptom reactions, prevent and reverse microorganism infections, maintaining human biological health and providing for the reversal of degenerative diseases is to maintain a normal alkaline body pH, hyperoxia and an adequate negative static magnetic field. The biological response to a negative static magnetic field can maintain these necessary components of healthy human cells. Thus it can be understood that exposure to an external source of a negative static magnetic field supports human health and materially aids in reversal of inflammatory degenerative diseases, cancer and the defense against microorganism invasion. This external negative static magnetic field can be applied to local affected areas as well as applied systemically by such as a negative static magnetic field bed.

**The Significance of Alkalinity and Acidity
in Biological Health and Disease**

The human body functions in an alkaline dependent state. Hyperoxia, which is necessary for the production of adenosine triphosphate (ATP), can only be present in an alkaline medium. An acid medium ties up oxygen, which is no longer free for the oxidation-reduction process of producing ATP. A healthy human maintains a blood pH minimum of 7.4. Below 7.4, the numerous necessary enzymes for life function in a human lose their function because they are alkaline-dependent. Alkaline minerals such as sodium, magnesium, potassium, and calcium as bicarbonates are a necessary part of the pH buffer system maintaining alkalinity. Therefore, it is necessary that these nutrients be in adequate supply. Insulin also helps maintain the alkalinity, the production of which rises and falls depending on the need to maintain the alkalinity. This is one of insulin's functions. Endorphins, insulin and nutrients producing bicarbonates are all alkaloids and therefore have a normal physiological level. This normal physiological alkalinity is anti-inflammatory, buffers against infections and cancers that are acid-

Medical data is for informational purposes only. You should always consult your family physician, or one of our referral physicians prior dependent.

Degenerative diseases such as diabetes mellitus, rheumatoid arthritis, local and systemic infections are all acid states in which local areas of the body are acidic and also there are measurable episodes of systemic acidity in these degenerative diseases.

It is highly significant to understand that sensitivity, symptom-producing reactions to foods and or chemicals are acid-producing. I have measured thousands of these symptoms occurring during deliberate exposure to foods and chemicals and when symptoms occur there is a measurable acidity occurring in the blood. The local area where the symptom occurred is even more acidic than the blood. Degenerative diseases have been demonstrated to simply be an extension in time of these acute symptom-producing reactions to foods, chemicals and inhalants. It matters not whether these are immunologic with demonstrated antibodies or complement disorders or whether they are non-immunologic. Acidity occurring at the time of either acute symptom production or chronic disease symptoms is the central common denominator. It is true that immunologic reactions are also acidifying but it is also true that there are many times more non-immunologic type reactions that are acidifying and thus, symptom-producing.

Addiction, whether it is to narcotics or other drugs, or to foods has an acidic phase during the withdrawal of that substance. In addictions, the withdrawal begins to occur at 3-4 hours, post-exposure. Addiction to foods turns out to be the most common cause of symptom producing maladaptive sensitivity reactions to foods. The frequently eaten food becomes a stressor, which is beyond the body's biological capacity to optimally process. When first exposed to the food to which the subject is addicted, there is relief of symptoms because the stress evokes a rise in endorphins and serotonin. Some four hours later, when both endorphins and serotonin drop below the normal functional physiological levels, acidity emerges and symptoms occur. This is why it is so important that all addictions be stopped at the same time. Thus, this includes alcohol, tobacco, caffeine, and all foods to which the person is addicted.

The Role of Oxidoreductase Enzymes in Addiction Including Food Addictions

Members of the Oxidoreductase enzyme family classified by their function are as follows:

1. Dehydrogenases
2. Hydroxylases
3. Oxidases
4. Oxygenases
5. Peroxidases
6. Reductases

Oxidoreductase enzymes are responsible for the production of adenosine triphosphate and oxidation remnant magnetism (negative magnetic field). This is an alkaline-hyperoxia negative (south-seeking) magnetic field dependent enzyme catalytic reaction. When the frequency of a substance exceeds the available functional capacity of oxidoreductase enzymes, then this becomes a stress. The body's response to stress is to raise endorphins and serotonin. This stress over-produces endorphins and serotonin beyond their normal physiological level, thus providing not just a comfortable feeling, but also a super comfortable, even euphoric feeling. Some 3-4 hours later, the production of endorphins and serotonin drop below physiological level, which is now an acidic, inflammatory, psychologically depressive and anxiety-producing state. When oxidoreductase enzymes can be maintained at a normal physiological level,

this addictive state does not occur. We know this is true because when we expose the brain and the symptomatic areas to a negative (south-seeking) magnetic field, it will activate the oxidoreductase enzymes and thus relieve the symptoms. This fact also becomes the center focus for handling the symptoms of addiction in general and food addiction in particular. By the use of a negative (south-seeking) magnetic field applied to symptomatic areas and the brain, the withdrawal from addictive substances including foods can be made comfortable. Maintaining comfort while withdrawing from food addiction is an important part of magnetic therapy of reversing food addiction.

THE ROLE OF ADDICTION IN OBSESSIVE-COMPULSIVENESS

Obsessive-compulsiveness can be a learned response from environmental experiences. However, much of obsessive-compulsiveness is learned from addiction. When contacting the addictive substance, food or otherwise, the subject is super comfortable without body pains and with a mental euphoria. When the addictive withdrawal phase sets in and the discomforts leave and pains, depression, anxiety and tension emerge, there develops first an obsessional wish to obtain relief by contact with the addictive substance again and a compulsion to act on that obsession. Addiction classically trains in obsessive-compulsiveness, which then pervades the entire behavior of the subject. The addict simply, obsessively, can't wait for relief. They can't accept any imperfection, including waiting for relief. Physical pain can be relieved by placing a negative (south-seeking) magnetic field over the area of pain. Brain symptoms can be relieved by placing the negative (south-seeking) magnetic field over the bitemporal areas of the brain. Bitemporal area placement of the discs relieves depression and tension. Placing a magnetic disc midforehead and left temporal relieves anxiety. Placing a magnetic disc over the left temporal and low occipital area is the most effective for relieving obsessive-compulsiveness.

It is understandable that overeating of calories becomes an obsessional compulsive component of food addiction. The system of magnetic weight reduction is to, first of all, stop all addictions. Secondly, handle all the withdrawal symptoms of stopping all addictions. The third is to decide the number of calories that needs to be consumed to maintain an appropriate weight. Eat this number of calories and stop any compulsion to overeat by placing the magnets appropriately on the head as well as a 4" x 6" x 1/2" magnet on the mid-sternum and over the epigastric area. Also, treat any areas of discomfort at the same time. By this method, the person learns with comfort to eat only the amount of calories that will maintain adequate weight. If there is an urge to eat between meals, then place the magnets on the head, the chest and on the epigastric area. Within 5-10 minutes, this urge will have disappeared. Thus, there is a method of self-help maintenance of comfort and magnetic cancellation of obsessive-compulsiveness.

Grandfather Status of Magnet Therapy

Among early medical practitioners, there are references to the medical uses and self-help uses of static field magnets. This description of static magnetic fields for medical use and self-help application holds a record for being among the longest, if not the longest, held application of medical therapeutics. The application of magnetic therapeutics is world-wide. This worldwide grandfather status of application of static magnetic fields for therapeutic reasons is important in view of the more recent establishment of research practices to prove the value and safety of procedures and products. Among the earliest effort at establishing through scientific means, the value of magnetics

Medical data is for informational purposes only. You should always consult your family physician, or one of our referral physicians prior is that of the research establishing both the value and safety of the application of magnetic energy for magnetic resonance imagery.

Up to the 1970's, medical practices and sciences had been accepted because of their universal acceptance and application. There now are specific research techniques accepted by the Food and Drug Administration as valuable in establishing a scientific proof of both value and safety. Most medical practices have come to be accepted without this research proof. To this day, a substantial amount of medical practice is grandfathered and proceeds to be used without scientific proof. There is no official list of practices that have been grandfathered. They simply continued to exist without being challenged as to value and safety. Magnet therapy has existed since the early status of the practice of medicine and this has been worldwide. Although, not officially stated as grandfathered, its practice demonstrates that it is grandfathered in the United States and worldwide. In recent years, there has been an increase in the application of magnetics. Years ago, Sears Roebuck used to sell magnets for the relief of pain. In recent years there has been an increase of use of magnets for pain, sleep and other procedures. Magnetic therapy is also, at the same time, undergoing a scientific investigation as to values and limitations. National Institutes of Health is granting funds for this research. There are also privately funded researches in progress.

For many years, biochemistry has been fulfilling its promises of value and of financial rewards for marketing products. Biophysics has been largely ignored in terms of research for years. The times are changing and biophysics is now offering substantial rewards for harnessing magnetic applications.

An Invitation To Do Research In Therapeutic Magnetics

Dear Doctor:

This is an invitation for you to do research in the area of medical magnetics. The research physician works under the consultation and supervision of William H. Philpott, M.D., who is a member of an FDA qualified institutional review board. The research-monitoring physician gives a statement as to the status of the patient and Dr. Philpott provides a magnetic research protocol to be followed in applying the magnets. The research physician agrees to send reports to Dr. Philpott, which then will be assessed by the magnetic research committee. When sufficient data is available on any one subject, then this is submitted for publication in a peer reviewed medical journal. The purpose of this research is to establish magnetics as a solid therapeutic modality in the practice of traditional medicine. This is a request to you to join us in this valuable research. It does not cost you anything to be a party to this research. The patient pays the physician for any service rendered. The patient also buys the magnets used in the research.

The application of magnets to humans and animals for both diagnosis and therapy is FDA approved. There are several approved magnetic instruments that can make claims of value in the specific limited areas that their research has established.

Our research is on the growing edge of therapeutic magnetics, expanding the value of magnetics to human and animal therapeutics. There are many promising values emerging that need definitive research. Would you please help us?

Sincerely,

William H. Philpott, M.D.

Magnetic Therapy

Medical Supervised Research

VS.

Self-Help Treatment

Medical Supervised Research

The objective Observations of the value of magnetic therapy for numerous medical conditions demonstrates what is usually considered to be "too good to be true." Indeed, magnetic therapy de-

serves definitive, controlled research following all the guidelines of the FDA. This research is in process under the supervision of William H Philpott, M.D. and other independent research organizations as well as NIH grant-sponsored researches. This research under William H. Philpott, M.D. requires a local physician to be following the patient. A physician and patient provide Dr. Philpott with a definitive diagnosis and the physician and patient both agree to be reporting at least 3 times a year to Dr. Philpott. Dr. Philpott provides a magnetic research protocol giving the details of the magnets used. This is a home treatment. To defer the cost of this, a gift of \$200 is needed. This is a tax-deductible gift to medical research. This is beyond the cost of the individual magnets that are specified for the condition under consideration. This information is part of a statistical study in preparation for publication in peer reviewed medical journals.

Self-Help Magnetic Therapy

William H. Philpott, M.D. has since 1995 prepared The Magnetic Health Quarterly that range widely on specific subjects. These quarterlies describe magnetic treatment that can be adapted to self-help. Also, there is a series of magnetic protocols describing in general terms treatment of specific conditions but not for a specific person. It is ethical to obtain this information that lends itself to self-help use. There is no restriction in the purchase of magnets. When a person does self-help is his responsibility. The application of magnets has been classified by the FDA as not being harmful. There is misuse of the magnets that can be made, such as using the positive magnetic pole for an extended period of time. Although this does not injure cells, it is acidifying and would not be healthy for long-term use. The cost of self-help is the purchase of a Magnetic Health Quarterly on the appropriate subject. Each Magnetic Health Quarterly costs \$12, and each magnetic protocol for self-help costs \$10. Otherwise, the cost of self-help is the cost of the magnets. In doing self-help, the person obtains the general information and decides without any coaching from anyone, what magnets they want to use and how they want to apply them based on the general information they have received. Many people are admirably helping themselves. It is always wise that major illnesses be under the supervision of the medical research program.

THE MAGNETIC RESONANCE THERAPEUTIC RESEARCH PROJECT:

PHYSICIAN'S PARTICIPATION AGREEMENT

I agree to consult with W.H. Philpott, M.D., in setting up a research project in magnetic resonance therapeutic research. An agreed upon format of monitoring during treatment and after treatment will be followed. The agreed upon format will be provided in printed form so that the research format can be followed by multiple cases and multiple physicians.

I agree to provide a report three times a year. When sufficient data has been accumulated, and the Institutional Review Board agrees, then an author for publication in a peer review journal will be sought.

**THE MAGNETIC RESONANCE THERAPEUTIC
RESEARCH PROJECT:**

PATIENT'S AGREEMENT FOR RESEARCH

I understand this is a research project to determine the value of static magnetic field application to my type of condition. I understand that extensive toxicity studies preceding the Food and Drug Administration (FDA) approval of the marketing of magnetic resonance imagery resulted in the FDA's classifying magnetic exposure to humans as "not essentially harmful." I have not been promised symptom relief. I have not been promised a cure.

I agree to keep an accurate record of my extent of exposure to a magnetic field. I agree to the necessary monitoring of my condition before, during and after treatment as agreed to by my physician in consultation with W. H. Philpott, M.D.

I understand that private and government (Medicare and Medicaid) insurances do not apply for medical research. I understand my physician will not apply for insurance payments for the medical research that is being rendered me. I agree not to apply for insurance payments since they do not apply to medical research. I understand that laws relating to medical treatment for Medicare and Medicaid payments do not apply to medical research. I understand that the physician doing medical research monitoring for my case can charge for the service rendered for which no report to government insurance Medicare or Medicaid) is made and that the research service is beyond, apart from, and not related to any laws relating to medical services rendered to a Medicare or Medicaid patient.

Address:
Date:

SELF-HELP TREATMENT RESPONSIBILITY

You have a right to purchase magnets and do with them as you wish. You have a right to purchase information that is general in nature. The application of self-help does not constitute a medical order.

William H. Philpott, M. D. would appreciate periodic reports of your success. He can use this information in gathering research for publication.

I understand that I am taking responsibility for magnetic treatment if I engage in self-help, non-medical supervised therapy.

I understand that any of the general information that Dr. Philpott has prepared is not a medical order. I understand that any conversation that I have had or will have with Dr. Philpott is general in nature and is not to be construed as a medical order.

**INDEPENDENT, SELF-SUPPORTING
RESEARCH DETERMINATION OF THE
VALUES OF MAGNET THERAPY**

There is a steady advancing application of magnetics for health maintenance as well as valuable therapeutic reversal of degenerative diseases. There is a great need to document the many values of the application of magnets for their therapeutic value. The FDA has classified magnetic application to humans as "not essentially harmful." William H. Philpott, M.D. is a chairman of an independent ethical Research Institutional Review Board which follows FDA guidelines for research in magnetics.

Therapeutic research format available:

1. A local physician provides William H. Philpott, M.D. with an initial statement of the research subject's condition prior to magnet therapy. After receiving this initial statement, Dr. Philpott prepares a magnet research protocol to be followed.

The local research monitoring physician makes the initial report and additional reports to Dr. Philpott at four month intervals.

For this consultation service of the research protocol, the initial and periodic communication with the monitoring physician and research subject there is a requested medical research gift of \$200.00. You will receive a receipt for a tax deductible medical research gift. Make your medical research gift payable to HOLOS INSTITUTES OF HEALTH, INC. Send the check or credit card number to William H. Philpott, M.D.

This \$200.00 medical research gift plus the research subject purchasing the magnets used in research makes it economically possible to proceed with self-supporting magnet research.

For research treatment guided by Dr. W. H. Philpott with you monitored by a local physician. Call, write or fax:

MEDICAL SUPERVISION IS RECOMMENDED

MAGNETIC PROTOCOL

THE MAGNETICS OF SLEEP
DOUBLE AUDIENCE

The Magnetic Health Quarterlies are designed for both scientist and lay audiences. To maintain lay audience interest, scientific terms are kept at a minimum.

The identification of magnetic poles will follow the recommendations of B. Belaney in the Encyclopedia Britannica using the term electromagnetic definition of negative and positive. A magnetometer using negative (-) and positive (+) for magnetic pole identification is used for pole identification. For those used to and comfortable with the traditional compass needle geographic naming of the magnetic poles as north-seeking and south-seeking, the traditional identification of magnetic poles will be placed in brackets as negative (south-seeking) and positive (north-seeking).

Sleep and Health

Sleep is the great restorer of biological energy. Without adequate sleep, humans become weak, toxic, invaded by microorganisms with an increase in the development of degenerative diseases and aging. Certain it is that sleep is absolutely necessary for the maintenance of health and happiness. Following are some of the major factors involved in sleep and interference with sleep.

Circadian Rhythm

Human physiology has a wakeful period and a sleep period. The wakeful period is driven by environmental factors which excite the brain such as light and a positive (north-seeking) magnetic field coming from the sun. The sleep period is governed by the lack of light and the sunshine and skyshine having disappeared and the crust of the earth which is a negative (south-seeking) magnetic field, encourages rest, relaxation and sleep. Thus, we see the wakefulness governed by a positive (north-seeking) magnetic field and the sleep governed by a negative (south-seeking) magnetic field. It is important to understand this since we use this fact of a negative (south-seeking) magnetic field governing sleep to produce sound sleep. This sleep period also controls the expression of hormonal production. The wakeful period activates the production of catabolic hormones such as thyroid, adrenocortical hormones and some others. The sleep period activates the production of anabolic hormones such as melatonin and growth hormone. It has been demonstrated that melatonin can be produced at will by exposure to an anti-stress magnetic field. The optimum anti-stress magnetic field is that of a negative (south-seeking) magnetic field placed at the top of the head so the pineal gland, which produces melatonin, and the hypothalamic area of the brain, which produces growth hormone, are in the magnetic field. It is also of interest to note that the most optimum time for the production of melatonin and growth

hormone are in the late P.M. such as 11:00 P.M. and early A.M. such as up to 1:00 A.M. or 2:00 A.M. There are external factors that interfere with this circadian rhythm such as sun flares which are a positive (north-seeking) magnetic field that can excessively activate the human brain and other areas of the body. It has been particularly noted that subjects predisposed to mental illness have been noted in substantial numbers to develop an acute exacerbation of their illness at the time of sun flares. It also would encourage the growth of microorganisms and help produce epidemics of these human-invading microorganisms. In the far northern hemisphere, there are the long night periods and the long light periods. This also disturbs the circadian rhythm. On the other hand, many people work at night which disturbs the circadian rhythm. It is important to set up artificial magnetic fields. This can be done by sleeping at night on a magnetic negative (south-seeking) poled bed pad and with the negative (south-seeking) pole of magnets at the crown of the head so that no matter what the external circumstances (such as long periods of light or night or working at night) all be handled by setting up an artificial sleep/wake cycle. Bright light has been used to offset the depression that occurs during the long periods without light. However, what we have observed is that if you sleep with magnets at the crown of the head you will be governing the sleep/wake cycle and the bright light serves no particular purpose. Therefore, it is understood that you could drive the circadian rhythm either by waking up to bright light or using magnets to sleep soundly. It is a matter of driving the circadian rhythm. The more practical solution to this is to sleep at night with the negative (south-seeking) pole of magnets at the crown of the head and on a negative (south-seeking) poled magnetic bed pad because this has the optimum potential of raising melatonin and growth hormone.

MAGNETS USED

The magnets used are permanent and flat-surfaced, thus providing the ability of separation of the positive (north-seeking) and negative (south-seeking) magnetic fields. A static magnetic field is an energy field by virtue of it's movement of electrons in the magnetic field. There are single negative (south-seeking) and single positive (north-seeking) magnetic fields. The most useful application is achieved by separating the magnetic poles by use of flat-surfaced magnets with opposite poles on opposite sides of the flat surface. The magnetic polarity is purposely identified as positive and negative rather than north-seeking or south-seeking. The human body functions as a direct current circuit with the body of the neurons in the brain and spinal cord being positive and their extensions into the periphery of the body being negative. Therefore, by using the medical definition of electromagnetic polarity, we have a direct parallel without any necessity of translation in applying magnetic fields to the human body. A positive electric field produces a positive magnetic field and a negative electric field produces a negative magnetic field and this is why both electricity and magnetism can use the same sign.

THE MELATONIN HORMONE FACTOR

Melatonin is made by the pineal gland which is centered in the head. It has been documented to be responsive to a magnetic field. A negative (south-seeking) magnetic field evokes melatonin and a positive (north-seeking) magnetic field stops the production of melatonin. A 60-cycle per second cuts the production of melatonin and therefore, it is important not to sleep in a 60-cycle per second electric field. There should not be an electric clock, water bed heater, electric blanket, etc. in the bedroom. Light stops the production of melatonin, therefore, it is important to sleep in total darkness. If total darkness cannot be arranged, then cover the eyes and forehead to prevent a response to light. Melatonin governs the

Medical data is for informational purposes only. You should always consult your family physician, or one of our referral physicians prior production of sound sleep. Melatonin has been documented as having anticancer values, anti-aging value, control of endocrine function, control of immune function, control of respiration and in fact, control of all body energy systems.

GROWTH HORMONE FACTOR

Growth hormone is also produced at night when asleep, as is melatonin. Growth hormone is also under the control of melatonin. Growth hormone has to do with growth and therefore, also with healing. It is the hormone that makes it possible for amino acids to be turned into proteins which then are used as building blocks in the growth and healing process of the human body. Growth hormone has the control over the health of skin, nails, hair and also muscle mass. With growth hormone, the skin should maintain its normal thickness. Growth hormone has control over fat cells and is necessary for fat cells to be able to drop their fat. Interestingly enough, the growth hormone rises at night and very little is present during the day. It is interesting to note that fat cells drop their fat at night when we are asleep. Maybe there is such a thing as a beauty sleep.

THE pH FACTOR

Acid-base balance is controlled by a magnetic field. A positive (north-seeking) magnetic field is acidifying and a negative (south-seeking) magnetic field is alkalinizing. When sleeping at night in a negative (south-seeking) magnetic field, the human body becomes more alkaline. The alkaline factor is very essential since oxygen can only be available in an alkaline medium otherwise, in an acid medium the oxygen becomes tied up and not effective as an oxidizing agent. If we are reacting to a food, either immunologically with the production of antibodies, allergic-like maladaptive reaction, produced by oxidoreductase enzyme inhibition, addictive reactions or toxic reactions we become acidic and this would disturb our sleep. Therefore, it is important that the person not be addicted or maladaptively reactive to foods, chemicals, inhalants or toxins. It is important that these factors be handled so that sound sleep can be achieved. The magnets can do much to offset these acidifying factors and provide sound sleep. Logically, we should function at the levels of stopping these acidifying reactions and at the same time, sleeping in a negative (south-seeking) magnetic field from a magnetic bed pad and with magnets at the crown of the head.

THE PAIN FACTOR

The discomforts of pain keep people awake. The pain is often caused by the acidic state caused by the reactions to foods, chemicals and inhalants or toxic state. Placing the negative (south-seeking) pole of a static field magnet over the area of pain is a great reliever of the pain produced by these acid states that reduce oxygen in local areas. Therefore, it is important to treat local areas that may be painful in order to obtain sound sleep. The magnets need to be larger than the painful area being treated. Some years ago, a man was involved in an accident which resulted in the removal of both legs above the knees. There was constant pain in both stumps for which no appreciable relief had been achieved. He fastened the negative pole of a 1-1/2" x 1/2" ceramic magnet over the painful area of each stump. He called the next day enthusiastically stating that the pain was relieved and he had a sound, refreshing sleep for the first time in years.

THE EDEMA FACTOR

When cells are swollen they are painful because they are lacking oxygen and are acidic. Cells that are swollen also cannot make their energy by the normal process of oxidation phosphorylation of adenosine triphosphate and oxidation remnant magnetism. It is important to treat any area of local edema with a negative (south-seeking) magnetic field in order to provide for the conditions of

sound sleep.

HOW TO HAVE SOUND, DEEP, HEALING, ENERGY RESTORING SLEEP

The person should sleep in total darkness. If total darkness cannot be arranged, a pad should be placed over the eyes and forehead which will not admit light. It is the response of the eyes and forehead to light that cuts off the production of melatonin and growth hormone when asleep at night. Therefore, if a person has light coming through a window or if sleeping in the daytime because of their work schedule, they should put a pad over their eyes and forehead during sleep.

It is important not to have any 60-cycle per second pulsing frequency such as comes from electric currents in the room. There should not be an electric clock, night light or any other electrical instrument in the room where a person sleeps. It has been shown that 60-cycle per second quickly cuts off the production of melatonin. To achieve the optimum help from a magnetic field, the subject can best sleep on a magnetic bed pad composed of mini-block magnets placed sufficiently close together so the magnetic field is a full negative (south-seeking) magnetic field. It is best to accompany this with magnets at the crown of the head. In fact, we have found magnets at the crown of the head to be even more effective in producing sound sleep than the bed pad itself. These magnets at the crown of the head are composed of four 4" x 6" x 1" magnets placed 3/4" apart in a carrier holding them firmly against the headboard. These magnets can be raised or lowered depending on the height of the pillow. The bottom of the magnets resting on the wooden dowel should be slightly below the back of the head when the head is on the pillow. The maximum magnetic sleep instrument is the super magnetic head unit composed of twelve 4" x 6" x 1" magnets in a wooden carrier surrounding the head.

GENERAL INFORMATION ABOUT MAGNETS:

Plastiform flexible magnets come in long strips. They can be obtained 2" wide, 3" wide and 4" wide. They can be cut whatever length is desired. They are 1/8" thick. They are frequently stacked together as two, to make them stronger for depth of penetration.

Common sizes are 4" x 4" x 1/8", 2" x 3" x 1/8" and a 4" x 6" x 1/8". They can be as long as is needed such as 12" long or 24" long. These longer ones can be used to cover the entire spine. When they are bent a few times, they break. If these magnets have broken, then they can be fastened together with duct tape and will still have the same magnetic value. Because they tend to break, they are cut in strips, 1-1/2" x 3/8". Four rows of these are placed in mats. The mats are 5" x 6" or 5" x 12". Usually they are placed double for the depth of penetration. A double flexible mat will have a therapeutic penetration of about 2". They are only useful for depth of penetration of 2". Ceramic block magnets can be placed on top of these to increase their depth. Large ceramic block magnets, such as 4" x 6" can be placed over these flexible mats to increase their strength considerably. For example, a double-magnet flexible mat with a 4" x 6" x 1/2" ceramic block magnet has a therapeutic penetration of 5".

Mini-block ceramic magnets are called Briggs blocks because they are used as the MAGNETO magnets in Briggs and Stratton gasoline motors. They are 1-7/8" x 7/8" x 3/8". These are cast mini-blocks. They have many therapeutic uses. They can be used on the head such as the temporal areas, frontal or occipital areas for headaches or management of emotional symptoms or seizures. They can be used on fingers or toes. They can be placed on top of the flexible mats to reinforce the depth of magnetic field penetration. They can be used directly on the joints, under or incorporated into wraps around joints. They are used in the magnetic mattress pad, the multi-purpose pads and the magnetic chair pads.

Medical data is for informational purposes only. You should always consult your family physician, or one of our referral physicians prior

Ceramic disc magnets are 1-1/2" x 1/2". These ceramic discs are cut from the larger 4" x 6" x 112" magnets. They serve numerous valuable purposes such as around the head to treat headaches or other central nervous system symptoms, around joints, over skin or subcutaneous lesions. The therapeutic value extends to about two inches.

Ceramic block magnets are 4" x 6" x 1/2". The therapeutic value extends for 6-7 inches. A ceramic block magnet that is 4" x 6" x 1" with a therapeutic value extending to 8 inches. The 4" x 6" x 1/2" ceramic block has many uses such as around joints or to penetrate deeply into the liver, internal organs, the heart or into the head such as for treatment of tumors. The 4" x 6" x 1" ceramic block magnets are used in the Vitality Sleeper to have a field that penetrates into the head during sleep. The Vitality Sleeper is composed of four ceramic blocks that are 4" x 6" x 1" placed in a row 3/4 inch apart. These ceramic blocks are placed upright in a wooden carrier that holds them firmly up against the headboard. They can be raised or lowered depending on the height of the pillow. They are shipped at the top of the carrier and need to be lowered so that the head is in the magnetic field. They are resting on a wooden dowel. The wooden dowel they are resting on should be slightly below the back of the head when the head is on the pillow.

A magnetic mattress pad is composed of mini-block magnets that are placed an inch and one-half apart throughout the pad.

The magnetic chair pad is composed of mini-block magnets placed an inch and one-half apart throughout the seat and the back of the pad.

The large multi-purpose pad is 14" x 25" and the small multi-purpose pad is 11" x 17". The pads are composed of mini-block magnets that are placed an inch and one-half apart throughout the pad. These multi-purpose pads have many uses such as being used on the back, the abdomen and up over the heart and the chest.

Optimum therapeutic value is obtained from a bed made of seventy 4" x 6" x 1" ceramic block magnets. Thirty-five magnets are placed in a wooden grid, 36" square. This grid of 35 magnets weighs 200 pounds. Two of these grids are placed end to end producing a bed 36" x 72". This bed can be placed on the floor, the bed spring or on top of the mattress. It will raise the bed about 2 or more inches high. Place a 2" eggcrate-type foam pad or other suitable futon over the magnet bed. Use this thin pad when treating metastatic cancer or systemic infections. When the bed is used for sleep, place it under a 4" mattress. The therapeutic value of this 70-magnet bed extends to 18".

A super magnetic head unit is composed of twelve 4" x 6" x 1" magnets in a wooden carrier surrounding the head. This provides an optimum negative magnetic field to the head for sleep. It is especially used for brain tumors, Alzheimer's, arteriosclerosis, post-stroke, brain infections and so forth.

The super magnetic hat is composed of thirty-four 1" x 1/8" neodymium disc magnets. This is for daytime use for any disorder of the brain. It is especially designed for brain tumors.

THERAPEUTIC SLEEP:

In maintaining health and reversing degenerative diseases, it is very important that there be deep, energy restoring sleep. It is necessary to sleep a full eight hours in every 24 hour period. Energy is used up during the day and is restored during sleep. The depth of energy restoring sleep is controlled by the hormone, melatonin, that is made during sleep. The principle area in which melatonin is made is the pineal gland which is in the center of the head. This gland makes melatonin in response to a negative (south-seeking) magnetic field. This is why it is so important to treat the head to a negative (south-seeking) magnetic field during sleep. The retina of the eyes also make melatonin and the intestinal wall makes me-

latonin. Treating these areas also raises melatonin. The hormone melatonin has the control of the entire energy system of the body including such as the immune system and the endocrine system.

Another hormone that is made during sleep is growth hormone which is made by the hypothalamus in the brain. Growth hormone has control over the health of skin, nails, cellular replication and also, respiration.

In order to achieve appropriate production of the hormones melatonin and growth hormone it is necessary to sleep in a completely light-free environment and without any 60 cycle per second electrical pulsing frequency. Therefore, there should not be a night light, an electric clock, an electric heated blanket or a heated waterbed. If light cannot be completely excluded from the bedroom, then place over the eyes and the forehead a light shield.

The magnetic mattress pad will encourage the production of melatonin by the gastrointestinal tract. Any magnetic treatment of the abdomen will encourage the production of melatonin by the wall of the gastrointestinal tract.

The eyes make melatonin, therefore it is important to treat the eyes to maximize sleep. Melatonin offers therapeutic protection against eye injury because melatonin is a scavenger for free radicals. When sleeping with the magnets in the Vitality Sleeper where the magnets are placed in a carrier up against the headboard, this does treat the eyes. However, this can be materially increased by using a light shield with magnets attached to the light shield. The magnetic eye unit has a 1/2" x 1/16" small neodymium disc on the inside of the light shield directly over the eyes. On the outside of the light shield, two of the 1" x 1/8" neodymium disc magnets are attached. It is best to tape these down on the light shield. This same light shield is used to place magnets over the sinuses, both the maxillary sinuses and the frontal sinuses. The optimum treatment of the eyes occurs when the super magnetic head unit is used which contains twelve 4" x 6" x 1" magnets surrounding the head.

QUESTIONS AND ANSWERS

Q- WHAT IS THE DIFFERENCE BETWEEN A BAR MAGNET AND A FLAT PLATE MAGNET?

A- A bar magnet is a bar in which the magnetic poles are on opposite ends of the bar. This may be a straight bar or curved like a horseshoe but the essence is that the poles are on the opposite ends of a bar. Horseshoe magnets have been very popular because when you have both poles adjacent to each other you have a stronger holding force. Bar magnets are used to pick up metals and have a strong holding force. A flat plate magnet could be the same way if half of the magnet has separate poles on the same side. The magnets used to hold items on a refrigerator door are usually flat magnets with both poles on the same side. This is used because this is a stronger holding magnet than a single magnetic pole. The bar magnets are not used in therapy because you do not wish to have both magnetic poles on the same side. A flat plate magnet has the magnetic poles on opposite sides of flat surfaces.

If you want to treat the head to improve sleep it is important to have a magnetic field that is a complete negative (south-seeking) field. This can be provided by having the negative (south-seeking) pole of magnets only facing the head and have them close enough together that when you are within two or three inches from this magnetic field, you have only the negative pole. A good way of providing this complete negative (south-seeking) magnetic field is to have four, 4" x 6" x 1" magnets placed 3/4" apart. It is important to have the magnets close enough together so when you are 1" or more away from the magnets you are in a complete negative (south-seeking) field. When treating a lesion, like a bruise, cut, infection, cancer, inflamed area, and so forth, it is important that the magnetic field be larger than the lesion being treated.

Medical data is for informational purposes only. You should always consult your family physician, or one of our referral physicians prior

Q- WHAT IS THE RATIONALE FOR USING THE ELECTRICAL TERMS POSITIVE AND NEGATIVE RATHER THAN THE TRADITIONAL MAGNETIC POLE TERMS OF NORTH OR NORTH-SEEKING OR SOUTH OR SOUTH-SEEKING?

A- Navigators use small bar magnets as a compass. The end of the magnet that pointed toward the geographic north pole of the earth was designated as "North" and the compass needle that pointed to the geographic south pole of the earth was designated "South". Note that the orientation of naming the poles was that of the compass needle not that of the geographic north pole of the earth. This is confusing and was really named wrong since opposites attract and the compass needle pole that points to the north pole of the earth is, in actuality, south pole and the compass needle that points to the south pole of the earth is actually north pole. An attempt at correction of this fact was introduced years later in which the compass needle pointing to the north pole of the earth was called north-seeking pole and the compass needle pointing to the south pole of the earth was called south-seeking pole. These definitions serve their purpose well in terms of navigation and industry, however, when trying to relate this polarity to the physiology of the human body a translation of terms had to occur in which a parallel between the direct current circuits as used in the human body parallel these traditionally used terms defining magnetic polarity. A magnetometer is an instrument that can be used to identify the positive and negative pole of a direct current circuit, the magnetic poles of the earth or a magnet. The magnetometer uses the electrical polarity definition of positive and negative. When you train the magnetometer on the north pole of the earth, it registers negative. When you train it on the south pole of the earth, it registers positive. The scientific literature does justify the use of the electrical definitions of poles as applied to static magnetic poles of a permanent magnet. In fact, a permanent magnet is made by a direct current circuit. The negative pole (-) passing through this magnetizable material produces a negative magnetic field (-qm, where "m" stands for magnetism). Some physicists not used to dealing with human physiology, are uncomfortable in this translation of terms simply because it is not the way they have usually made reference to magnetic poles. In my writings, I have purposefully used the electrical polarity terms of positive and negative rather than north-seeking and south-seeking so no translation is required when applying the magnetic fields to the human body.

Q- HOW CAN ONE DETERMINE THE NEGATIVE MAGNETIC FIELD OF A STATIC FIELD INDUSTRIAL MAGNET?

A- The recommended magnets are flat surfaced with magnets on opposite sides of the flat surface. The scientific instrument magnetometer is the ideal way to determine the magnetic poles. The magnetometer reads positive or negative. This is the electromagnetic definition of polarity and is equally applicable to the magnetic poles in an electric circuit and to the magnetic poles of a static field magnet. A compass can be used to make this determination. The compass needle that points to the north pole of the earth is the compass needle that identifies the negative field of a magnet. In terms of a navigational definition, this is the south-seeking pole since the true north pole of the earth seeks the south pole of the earth. The compass needle that points to the north pole of the earth is a south pole needle. It is termed the north-seeking pole of the compass needle. I advise that the determination of magnetic poles be made by the use of a magnetometer.

Q- HOW CAN WE PROVIDE A FLEXIBLE MAGNET FOR USE ON CURVED OR IRREGULAR AREAS OF THE BODY?

A- The multi-magnet flexible mat is composed of small plastiform magnets. These are placed close together throughout the mat. This makes for a very flexible mat. The mats come in 5" x 6"

or 5" x 12". The flexibility allows the mat to be placed around joints, shoulders, across the bridge of the nose, over the female breast and so forth. The magnets are padded which provides on the surface, a full negative magnetic field of 25 gauss. This can be reinforced by placing an iron oxide ceramic disc magnet or neodymium disc magnet on the mat, directly over the lesion. The disc should be placed with the negative pole placed on the positive pole of the magnetic mat. This provides for a large spread of the magnetic field around the lesion with a more specific, stronger field directly over the lesion. A 2" x 26" body wrap is provided which can hold this mat in place anywhere around the head, smaller joints or across the eyes. A 4" x 52" body wrap is provided for holding the magnets in place in larger areas such as across the abdomen, breast or heart. Shoulder straps can be placed on this body wrap when the mat is being held on the chest, across the breast or heart. The flexibility of this magnetic mat makes it valuable for placement anywhere on the body. The mat has Velcro on the positive pole side which will hook to the body wraps, which also have Velcro so the mat and body wraps will fasten together.

Q- WHAT ABOUT USING THE POSITIVE MAGNETIC POLE (TRADITIONAL NORTH-SEEKING MAGNETIC POLE) RATHER THAN THE NEGATIVE MAGNETIC POLE (TRADITIONAL SOUTH-SEEKING MAGNETIC POLE) AS HAS BEEN RECOMMENDED IN THIS WRITE-UP?

A-The entrance of energy medicine into medical science has initially been reflexology with acupuncture being a classic example. Magnetism (especially in Japan) has been used as a reflexology method using the positive (north-seeking) magnetic field or combined positive (north-seeking) and negative (south-seeking) magnetic field. This low level positive magnetic field evokes the brain to reflexly send a negative magnetic field to the area to counter the stress of the low gauss positive magnetic field. There are two limiting factors to the counter irritant (stress) reflex method such as 1) the symptom corrective response is dependent on the subject's internal energy and 2) counter irritant reflex fatigues on an average of about eight weeks at which time symptoms reemerge. On the other hand, a negative (south-seeking) magnetic field is always anti-stressful no matter how long the contact or how high the gauss strength and therefore, the response to the negative magnetic field is always predictably consistent.

MAGNETIC PROTOCOL

MAGNETIC SLEEP PROTOCOL

ORIENTATION:

Sleep is a necessary aspect of biological life energy. The pineal gland response to a negative magnetic field is the production of melatonin. Melatonin drives sleep and governs the entire energy system of the body.

MAGNETS USED:

Minimal sleep program:

Two ceramic discs, 1-1/2" x 1/2" with Velcro on the positive pole side.

One 2" x 26" band.

Optimal sleep program:

Magnetic mattress pad composed of mini-block magnets that are 1-7/8" x 7/8" x 3/8" placed 1-1/2" apart throughout the bed pad.

Vitality Sleeper composed of four 4" x 6" x 1" magnets placed 3/4" apart in a wooden carrier that is up against the headboard. The magnets can be raised or lowered depending on the height of the pillow.

Maximal sleep program:

A 70-magnet bed. These magnets are 4" x 6" x 1". Each one weighs four pounds. Thirty-five of these are placed in a wooden grid that is 36" square. Two of these are placed end to end produc-

Medical data is for informational purposes only. You should always consult your family physician, or one of our referral physicians prior ing a bed 36" x 72". Each wooden grid with 35 magnets weighs 200 pounds, thus the total bed is 400 pounds.

Super Magnetic Head Unit. This is composed of twelve 4" X 6" X 1" magnets in a wooden holder. There is a space for the head. The head is surrounded by these magnets.

PLACEMENT AND DURATION:

For the minimal sleep program, place the two discs on the head. These are placed bitemporally, that is at the front of the ears at the level of the front of the ears. This is held in place with the 2" x 26" band. This can be worn at night during sleep. It also can relieve symptoms during the day. The more hours of exposure, the better.

Optimum sleep program. The mattress pad is made of mini-block magnets that are 1-7/8" x 7/8" x 3/8" placed 1-1/2" apart. There are single and queen size beds. For the king-size bed use two of the singles. Sleep every night on this bed pad. Associated with this is sleeping with the Vitality Sleeper which has four 4" x 6" x 1" magnets in a carrier up against the headboard. They can be raised or lowered depending on the height of the pillow.

Maximal sleep program: Sleep on the 70-magnet bed pad. Place a 2" eggcrate-type foam pad over the mattress or other suitable thin futon. Not only does this bed provide for optimum sleep but also it can treat metastatic cancer or viral infections. If it is not treating major illness, then it can be placed under a 4" mattress. At the same time that this bed is used, sleep with the super magnetic head unit. This super magnetic head unit, beyond encouraging sleep, is capable of treating brain tumors, brain infections, Alzheimer's and cerebral arteriosclerosis.

FINAL WORD

Human energy is restored at night during sleep and used up during wakefulness. Human life is composed of a wakeful period and a sleep period. The sleep period is necessary to make the wakeful period available. During the sleep/no light period, the adenosine triphosphate (ATP) is being made in excess of its use in metabolic functions. Each catalytic reaction producing ATP from food also produces a negative magnetic field. This cumulative negative magnetic field energizes enzyme catalysis.

Sleep raises growth hormone which controls many metabolic functions. Sleep is energy-driven by a negative magnetic field. Melatonin is produced by a negative magnetic field response of the pineal gland. Melatonin drives sleep.

SLEEP IS PRODUCED BY A RISE IN MELATONIN. THE PINEAL GLAND PRODUCES MELATONIN AS A RESPONSE TO A NEGATIVE MAGNETIC FIELD. HUMAN BIOLOGY LIFE ENERGY IS USED UP DURING THE WAKING PERIOD AND MADE DURING THE SLEEPING PERIOD.
